

Module description

for the degree programme

Master of Science Advanced
Optical Technologies

(Version of examination regulation: 20222)

for the winter term 2025/2026

Table of contents

Master's thesis (1999).....	5
Internship (1996).....	7
Project report (1994).....	8
Fundamentals of Optics (42101).....	9
Basics of Laser (42105).....	11
Numerical Methods and Topics in Optical Technologies (42110).....	13
Optical Metrology	
Thermophysical properties of working materials in process and energy engineering (44960).....	15
Product analysis (45370).....	19
Optical technologies in life science (45730).....	21
Nonlinear optics (582360).....	24
Glass I (46228).....	26
Optical diagnostics in energy and process engineering (42935).....	28
Novel techniques in ultrafast spectroscopy (67009).....	31
Modern optics 1: Advanced optics (48311).....	33
Photon & neutron scattering for structure determination (94474).....	35
Optical Material Processing	
Advanced Laser (42130).....	39
Optical Lithography: Technology, Physical Effects and Modeling (42140).....	41
Scanning and printing in 3D (46100).....	43
Engineering of solid state lasers (94930).....	44
Laser system technology I: High-power lasers for material processing: designs, basics of beam guidance and shaping, applications (95360).....	46
Laser technology (97150).....	48
Laser system technology II: Laser safety, integration of lasers in machines, control and automation technology (97283).....	50
Laser tissue interaction (763337).....	52
Optics in Medicine	
Photonics in Medical Engineering (42145).....	55
Optical technologies in life science (45730).....	56
Photonics for medical applications (47650).....	59
Laser tissue interaction (763337).....	61
Fundamentals in anatomy and physiology for engineers (47664).....	63
Magnetic resonance imaging 2 + exercise (568977).....	65
Magnetic resonance imaging (122337).....	67
Photonics in medical technology (47624).....	68
Find the disease Case based teaching (746003).....	70
Optics in Communication	
Modern optics 3: Quantum optics (48313).....	72
Advanced nonlinear optics (67143).....	73
Waveguides, optical fibres and photonic crystal fibres (67145).....	75
Quantum communication (67188).....	77
Linear and non-linear fibre optics (267499).....	78
Nonlinear optics (582360).....	80
Advanced optical communication systems (621649).....	82
Arduino hardware and software for lab applications and beyond (67111).....	84
Introduction to quantum communication (67092).....	86
Methods in theoretical quantum optics (67212).....	88
Quantum Information Processing: Implementations (67211).....	90

Optical Materials and Systems	
Advanced Laser (42130).....	93
Optical Lithography: Technology, Physical Effects and Modeling (42140).....	95
Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	97
Thermophysical properties of working materials in process and energy engineering (44960).....	99
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	103
Waveguides, optical fibres and photonic crystal fibres (67145).....	105
Modern optics 1: Advanced optics (48311).....	107
Glass I (46228).....	109
Glass II (46229).....	111
Photovoltaic systems - Fundamentals (42923).....	113
Photovoltaics (PV) and PV Systems II: Light conversion and light management (46253).....	115
Nonlinear optics (582360).....	118
Advanced nonlinear optics (67143).....	120
Ceramic materials: Processing and properties (46222).....	122
Computational Optics	
Computational Optics (43221).....	125
Computational photography and capture (43386).....	127
Pattern analysis (44120).....	129
Pattern recognition (44130).....	131
Computer vision (713618).....	133
Quantum computing (67156).....	135
Computational visual perception (93173).....	137
Implementations of Quantum Error Correction (67016).....	139
Methods in theoretical quantum optics (67212).....	141
Physics of Light	
Advanced Laser (42130).....	144
Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	146
Modern optics 3: Quantum optics (48313).....	148
Advanced nonlinear optics (67143).....	149
Quantum computing (67156).....	151
Quantum communication (67188).....	153
Nonlinear optics (582360).....	154
Novel techniques in ultrafast spectroscopy (67009).....	156
Introduction to quantum communication (67092).....	158
Modern optics 1: Advanced optics (48311).....	160
Methods in theoretical quantum optics (67212).....	162
Quantum Information Processing: Implementations (67211).....	164
Related Fields	
Introduction to machine learning (65718).....	167
Methods of data analysis I (67172).....	170
Machine learning for engineers I - Introduction to methods and tools (95067).....	172
Machine learning for engineers II: Advanced methods (95068).....	174
Machine learning for physicists (668977).....	176
Deep learning (901895).....	177
Advanced experimental physics (66941).....	179
Advanced theoretical physics (66961).....	183
Theoretical physics: Solid state physics (67021).....	185

Functional analysis for engineers (43230).....	187
Data science survival skills (47677).....	188
Advanced Programming Techniques (44171).....	190
Elements of Artificial Intelligence for Scientific Discovery (67141).....	192
Open Quantum Systems (67209).....	193
Seminar on the State-of-Art of MRI (44161).....	195
Lab courses major topic 1+2	
Laboratory course: Optics in medicine (42725).....	199
Laboratory course: Physics of light (42730).....	200

1	Module name 1999	Master's thesis (M.Sc. Advanced Optical Technologies 20222) Master's thesis	30 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Dr. Jürgen Grossmann
5	Contents	The students - independently pursue a scientific question of the corresponding subject area over a longer period of time and work on it within a given time limit. (Focus on self-competence/subject competence) - develop independent ideas and concepts to solve scientific scientific problems. (Focus on methodological competence/specialist competence) - deal with theories, terminologies, special features, limits and doctrines of the subject in an in-depth and critical manner and reflect on them. and reflect on them. (Focus on professional competence/self-competence) - apply and further develop appropriate scientific methods largely independently - also in new and unfamiliar as well as interdisciplinary contexts. (Focus methodological competence). - can present subject-related content clearly and appropriately to the target group in writing (and, if necessary, orally) and defend it argumentatively. (focus on social competence/specialist competence) - expand their planning and structuring abilities in the implementation of a thematic project. (focus on methodological competence/specialized competence). Please adapt the competencies to the professional requirements or expand them accordingly. Please note that theses written at other universities or in similar courses of study must be credited if they are equivalent. A precise module description helps to make the process of credit transfer (also the decision of non-credit transfer) transparent and to facilitate it for all parties involved.
6	Learning objectives and skills	The students - independently pursue a scientific question of the corresponding subject area over a longer period of time and work on it within a given time limit. (Focus on self-competence/subject competence) - develop independent ideas and concepts to solve scientific scientific problems. (Focus on methodological competence/specialist competence) - deal with theories, terminologies, special features, limits and doctrines of the subject in an in-depth and critical manner and reflect on them. and reflect on them. 		- apply and further develop appropriate scientific methods largely independently - also in new and unfamiliar as well as interdisciplinary contexts. (Focus methodological competence). - can present subject-related content clearly and appropriately to the target group in writing (and, if necessary, orally) and defend it argumentatively. (focus on social competence/specialist competence) - expand their planning and structuring abilities in the implementation of a thematic project. (focus on methodical competence/specialized competence). Please adapt the competencies to the professional requirements or expand them accordingly. Please note that theses written at other universities or in similar courses of study must be credited if they are equivalent. A precise module description helps to make the process of credit transfer (also the decision of non-credit transfer) transparent and to facilitate it for all parties involved. •
7	Prerequisites	Students must have earned 80 ECTS in order to register the master's thesis
8	Integration in curriculum	no Integration in curriculum available!
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Oral (30 minutes) Written or oral (6 Monate)
11	Grading procedure	Oral (10%) Written or oral (90%)
12	Module frequency	Every semester
13	Resit examinations	The exams of this module can only be resit once.
14	Workload in clock hours	Contact hours: 0 h Independent study: 900 h
15	Module duration	1 semester
16	Teaching and examination language	german or english
17	Bibliography	Depends on the subject of the thesis.

1	Module name 1996	Internship (M.Sc. Advanced Optical Technologies 20222) Internship	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Dr. Jürgen Grossmann
5	Contents	Students do an internship of five weeks full time (or an equivalent time part time) at an institute of the university, at another research institute or in the industry.
6	Learning objectives and skills	During the internship students learn how to work in an organisation in the field of optical technologies.
7	Prerequisites	None
8	Integration in curriculum	semester: 2
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Course achievement Students have to submit the confirmation that they have done the internship and write a small report about their activities (2-3 pages). The internship is not graded.
11	Grading procedure	Course achievement (pass/fail) Not graded
12	Module frequency	Every semester
13	Workload in clock hours	Contact hours: 0 h Independent study: 200 h
14	Module duration	1 semester
15	Teaching and examination language	german or english
16	Bibliography	

1	Module name 1994	Project report (M.Sc. Advanced Optical Technologies 20222) Project report	10 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	The student undertake a research project of about 300 h and write a project report about it under the supervision of a professor of the university. It should preferably be written in one of the major topics of the student.
6	Learning objectives and skills	Students learn how to • plan and carry out a research project • collect data and analyse them • present results in a structured report Students get prepared for writing the more comprehensive report of the module M16 Master's Thesis.
7	Prerequisites	None
8	Integration in curriculum	semester: 3
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Written assignment Report of about 15-25 pages
11	Grading procedure	Written assignment (100%)
12	Module frequency	Irregular
13	Workload in clock hours	Contact hours: 0 h Independent study: 300 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	Depends on the subject of the report.

1	Module name 42101	Fundamentals of Optics	15 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Prof. Dr.-Ing. Andreas Paul Fröba
5	Contents	• A Brief History • Wave Motion: One-Dimensional Waves, Harmonic Waves, Phase and Phase Velocity, Superposition Principle, Complex Representation, Plane Waves, Three-Dimensional Wave Equation, Spherical Waves, Cylindrical Waves • Electromagnetic Theory, Photons, and Light: Farady's Induction Law, Gauss's Law, Ampère's Circuital Law, Maxwell's Equations, Transverse Waves, Energy and Momentum, Averaging Harmonic Functions, Radiance and Irradiance, The Inverse Square Law, Photon Counting, Radiation Pressure and Momentum, Electric Dipole, Light in Bulk Matter, Dispersion, The Electromagnetic-Photon Spectrum, • The Propagation of Light: Rayleigh Scattering, Scattering and Interference, The Transmission of Light Through Dense Media, Transmission and the Index of Refraction, Reflection, Refraction, Huygens's Principle, Fermat's Principle, Electromagnetic Approach, Fresnel Equations, Total Internal Reflection, Evanescent Wave, Optical Properties of Metals, Stokes Treatment of Reflection and Refraction, Photons, Waves, and Probability, Quantum Electrodynamics, • Geometrical Optics: Lenses, Refraction at Spherical Surfaces, Thin Lenses, Finite Imagery, Thin Lens Combinations, Apertures and Field Stops, Entrance and Exit Pupils, Relative aperture and f-Number, Mirrors, Prisms, Fiberoptics, Human eye, Magnifying Glasses, Compound Microscop, Camera, Telescope, Wavefront Shaping, Thick Lenses and Lens Systems, Analytical Ray Tracing, Aberrations, • Superposition of Waves: Addition of Waves, Standing Waves, Anharmonic Periodic Waves, Nonperiodic Waves, • Polarization: The Nature of Polarized Light, Polarizers, Dichroism, Birefringence, Polarization by Reflection, Retardors, Optical Modulators, Mathematical Description, • Interference: Conditions for Interference, Temporal and Spatial Coherence, Holographic Interferometry, The Fresnel-Arago Laws, Young's Experiment, Wavefront-splitting Interferometers, Dielectric Films – Double-Beam Interference, Michelson Interferometer, Mach-Zehnder Interferometer, • Diffraction: The Huygens-Fresnel Principle, Fraunhofer and Fresnel Diffraction, Several Coherent Oscillators, Fraunhofer

		Diffraction, Fresnel Diffraction, Kirchhoff's Scalar Diffraction Theory
6	Learning objectives and skills	Students should be able • to describe and explain the experimental basics and the mathematical description of optic and quantum phenomena • apply laws of physics and mathematical methods to actual problems
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Written examination (150 minutes)
11	Grading procedure	Written examination (100%)
12	Module frequency	Only in winter semester
13	Workload in clock hours	Contact hours: 150 h Independent study: 300 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	Eugen Hecht: Optics

1	Module name 42105	Basics of Laser	5 ECTS
2	Courses / lectures	Praktikum: Basic of Lasers - Lab sessions (1 SWS) Vorlesung mit Übung: Basics of Laser (3 SWS)	1 ECTS 4 ECTS
3	Lecturers	Prof. Dr. Nicolas Joly	

4	Module coordinator	Prof. Dr. Nicolas Joly
5	Contents	Laser technology developed enormously since its first demonstration in 1960. Although at that time laser was described as "a solution in search of a problem" it is nowadays used everywhere, from high-precision spectroscopy to bar-scanner in supermarkets, from eye-surgery to metal welding for car industry. The lecture focuses on the basics of laser and serves as a first glance in the fascinating world of coherent light sources. It reviews four major aspects of lasers: (i) the description of the active material, which provides the gain for the system (ii) the laser cavity, which defines the spatial structure of the laser beam (iii) the propagation of laser beam using the ABCD matrices formalism and (iv) the different dynamical regimes of laser, in particular the way to generate pulses. Besides the lecture/exercises the students are invited to test the concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser. During lab exercises the students will work on concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser.
6	Learning objectives and skills	Students will be able to: • Describe the active material using the rate equations • Check the stability of a laser cavity and extract the beam parameters from the physical parameters of the cavity (length, radius of curvature of the mirrors etc.) • Use ABCD matrix to define the spatial properties of a laser beam and shape the beam (focusing, coupling etc.) • Align a laser cavity and observe the different spatial modes that can be generated • Understand the different dynamical behaviours of a laser (mode-locked laser, Q-switch laser, continuous).
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Practical achievement Written examination (90 minutes)

		At the end of the course there is a written exam (90 min). In addition the students have to write reports about two lab sessions.
11	Grading procedure	Practical achievement (20%) Written examination (80%)
12	Module frequency	Only in winter semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	"Laser by A.E. Siegman, University Science book, 1986 "Handbook of Lasers and Optics by F. Träger, Springer, 2007 "Les lasers by D.Dangoisse, D. Hennequin and V. Zehnlé)Dhaoui, Dunod 1998 "Principles of Lasers, 5th ed. by Orazio Svelto, Springer 2010

1	Module name 42110	Numerical Methods and Topics in Optical Technologies	5 ECTS
2	Courses / lectures	Vorlesung: Topics of Optical Technologies (2 SWS) Vorlesung: Numerical tools in optics (Matlab) (2 SWS)	2,5 ECTS 2,5 ECTS
3	Lecturers	Dr. Angela Perez Castaneda	

4	Module coordinator	Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	The module introduces the topics which can be chosen as major topics in the second and third semester of MAOT and the use of the software Matlab (or another numerical tool for the analysis of data).
6	Learning objectives and skills	Students (part "Numerical...") - do understand the basic concept of Matlab - do know the basic functions of Matlab - are able to apply Matlab for solving numerical problems in the field of optics (part "Topics...") - know different application fields of optical technologies - are able to decide about their major topics for the second and third term
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Course achievement Students have to - produce two presentations (15-25 page) about two of the seven majors as a group work (in groups of 4-6 students) - do several small Matlab exercises (1-2 pages code) and a more comprehensive project (4-7 pages) Both achievements are not graded.
11	Grading procedure	Course achievement (pass/fail)
12	Module frequency	Only in winter semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	Scripts and / or further literature will be distributed during the courses.

Optical Metrology

1	Module name 44960	Thermophysikalische Eigenschaften von Arbeitsstoffen der Verfahrens- und Energietechnik Thermophysical properties of working materials in process and energy engineering	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Andreas Paul Fröba PD Dr. Thomas Manfred Koller
5	Contents	• Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik • Gleichgewichtseigenschaften zur Charakterisierung von Arbeitsstoffen, z.B. in Form der thermodynamischen Zustandseigenschaften und -größen Dichte, innere Energie, Enthalpie, Entropie, spezifische Wärmekapazität, Schallgeschwindigkeit, Brechungsindex, Oberflächen- und Grenzflächenspannung • Transporteigenschaften zur Charakterisierung des molekularen Masse-, Energie- und Impulstransportes, z.B. Viskosität, Diffusionskoeffizient, Soret-Koeffizient, Thermodiffusionskoeffizient, Wärme- und Temperaturleitfähigkeit • Anwendungsbezogene Stoffdatenrecherche in der wissenschaftlichen Literatur, Tabellenwerken und Datenbanken • Korrelationen und Vorhersagemethoden für Stoffeigenschaften • Methoden zur experimentellen Bestimmung und prozessbegleitenden Messung von Stoffdaten, insbesondere durch moderne laseroptische Techniken • Grundzüge der theoretischen Bestimmung von Stoffdaten mit Hilfe der molekularen Modellierung • Aufstellung von thermischen und kalorischen Zustandsgleichungen *Content* • The importance of thermophysical properties in process and energy engineering • Equilibrium properties for the characterization of working materials, e.g., in the form of thermodynamic properties of state and other equilibrium properties such as density, internal energy, enthalpy, entropy, specific heat capacity, sound speed, refractive index, surface or interfacial tension, etc. • Transport properties for the characterization of molecular transfer of mass, energy, and momentum, e.g. diffusion coefficients, Soret coefficient, thermal diffusion coefficient, thermal conductivity, thermal diffusivity, and viscosity • Use-oriented inquiry of thermophysical property data in scientific literature, table compilations, and databases

		• Correlation and prediction of thermophysical properties • Methods for experimental determination and in-process measurement of thermophysical properties, in particular by laser-optical techniques • Basics of the theoretical prediction of thermophysical properties by molecular modeling • Development of thermal and caloric equations of state
6	Learning objectives and skills	Die Studierenden • sind mit der Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik in Form von Gleichgewichts- und Transporteigenschaften vertraut, • verwenden verschiedene Bezugsquellen für Stoffeigenschaften (Recherche in wissenschaftlicher Literatur, Tabellenwerken und Datenbanken; Korrelationen und Vorhersagemethoden; theoretische und experimentelle Bestimmung) eigenständig und wählen diese bedarfsgerecht und abhängig vom resultierenden Nutzen und Aufwand aus, • kennen die Herangehensweisen zur Korrelation und Vorhersage von Stoffeigenschaften sowie zur Aufstellung von thermischen und kalorischen Zustandsgleichungen und übertragen diese Herangehensweisen auf andere Stoffe, • sind mit experimentellen Methoden zur Stoffdatenbestimmung vertraut, insbesondere mit laseroptischen Messtechniken, • verstehen die Grundzüge der molekularen Modellierung zur theoretischen Bestimmung von Stoffdaten und • wählen Arbeitsmedien mit definierten Stoffeigenschaften für eine optimierte Gestaltung von Verfahren und Prozessen der Energie- und Verfahrenstechnik aus. *Education objectives and competences* The students • are aware of the importance of thermophysical properties in process and energy engineering in the form of equilibrium and transport properties, • use various sources for thermophysical properties (scientific literature, table compilations, databases, correlations, predictions, theoretical and experimental determination) independently and select the respective sources in a use-oriented way considering the resulting effort and benefit, • know the approaches for the correlation and prediction of thermophysical properties as well as for developing equations of state, and are able to transfer these approaches to other systems, • are familiar with experimental methods for the determination of thermophysical properties, in particular with laser-optical methods, • understand the basics of the use of molecular modeling for the theoretical determination of thermophysical properties,

		select working materials with defined thermophysical properties for an optimized design of processes in energy and process engineering.
7	Prerequisites	Grundkenntnisse der Technischen Thermodynamik sowie der Wärme-, Stoff- und Impulsübertragung Basic knowledge on engineering thermodynamics as well as heat, mass, and momentum transfer
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 20222 Optical Metrology Master of Science Advanced Optical Technologies 20222
10	Method of examination	Written or oral mündliche Prüfung zum Stoff von Vorlesung und Übung oral examination based on the contents of lectures and exercises
11	Grading procedure	Written or oral (100%)
12	Module frequency	Only in summer semester
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
15	Module duration	1 semester
16	Teaching and examination language	english

1	Module name 45370	Produktanalyse Product analysis	5 ECTS
2	Courses / lectures	Übung: Übung Produktanalyse (1 SWS) Vorlesung: Produktanalyse (2 SWS)	1 ECTS 4 ECTS
3	Lecturers	Dr.-Ing. Johannes Walter	

4	Module coordinator	Dr.-Ing. Johannes Walter	
5	Contents	The module introduces modern (optical) techniques for characterization of disperse systems in chemical engineering and materials science. The participants will learn general principles as well as where, when and on which time scale information on materials properties can be gained by the discussed methods. For disperse systems the latter can be for example particle size, particle shape, materials composition, electronic properties and surface chemistry as well as surface charge. • Introduction to Materials Properties and Classification • Sampling, Error Sources and their Analysis • Definition and Determination of Particle Distribution, Size and Shape • Principles Optics and Diffraction I • Principles Optics and Diffraction II • Diffraction, Rayleigh-, Mie scattering • Static and Dynamic Light scattering • X-Ray Scattering and Applications • Zetapotential and its measurement with optical methods • Analytical Ultra-Centrifugation with Multi-Wavelength Optics • Nonlinear Optics at Interfaces and its Application • Color and its Measurement: UV-Vis and Fluorescence Spectroscopy • Infrared and Raman Spectroscopy including Surface-Enhanced Techniques • Scanning Mobility Particle Sizer (SMPS) • Scanning Probe Microscopy and Electron Microscopy	
6	Learning objectives and skills	• The participants will learn about the fundamentals of light-matter interactions and acquire the necessary skills to understand the working principles of the discussed experimental methods. • The participants will learn which material property is accessible by the discussed methods for product analysis as well as where and when each method can be applied. • The participants will learn on how to judge the results of an individual measurement technique and will learn about its inherent boundaries (e.g. resolution etc.) • The participants will learn where a combination of several techniques is more promising.	
7	Prerequisites	None	
8	Integration in curriculum	semester: 1	

9	Module compatibility	Optical Metrology Master of Science Advanced Optical Technologies 20222
10	Method of examination	Oral (30 minutes) benotete mündliche Prüfung 30 min
11	Grading procedure	Oral (100%) Prüfungsnote entspricht Modulnote
12	Module frequency	Only in winter semester
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: 45 h Independent study: 105 h
15	Module duration	1 semester
16	Teaching and examination language	german english

3	Lecturers	Dr.-Ing. Franz Huber	

4	Module coordinator	Dr.-Ing. Franz Huber Prof. Dr.-Ing. Stefan Will
5	Contents	Introduction to conventional and novel optical techniques to measure state and process functions in thermodynamical systems: • Properties of light; properties of molecules; Boltzmann distribution • Geometric optics and optical devices • Lasers (HeNe, Nd:YAG, dye, frequency conversion); continuous wave and pulsed lasers • Photoelectric effect; photodetectors (photomultiplier, photodiode, CCD, CMOS, image intensifier); digital image processing; image noise and resolution • Shadowgraphy and Schlieren techniques (flow and mixing) • Elastic light scattering (Mie scattering, Rayleigh thermometry, nanoparticle size and shape, droplet sizing) • Inelastic (Raman) scattering (species concentration, temperature, diffusion) • Incandescence (thermal radiation, temperature fields, pyrometry, particle sizing) • Velocimetry (flow fields, velocity) • Absorption spectroscopy (temperature, pressure, species, concentration) • Fluorescence and phosphorescence (temperature, species, concentration)
6	Learning objectives and skills	Students gain technical and technological skills in the field of optical techniques for the measurement of state and process variables in thermodynamic / energy processes and the investigation of these processes. They • are familiar with the state of the art and latest developments in optical measurement techniques applied in thermodynamics / energy processes • can assess the applicability of measurement techniques in different environments • can apply different optical measurement techniques in thermodynamic processes and design experiments

		• can evaluate data gained from optical measurement techniques and assess the quality of data • know interdisciplinary approaches in the fields of optics, thermodynamics, heat and mass transfer and fluid mechanics • are qualified to perform applied and fundamental research and development tasks in industry and at university in the field of optical measurement techniques for thermodynamic / energy processes
7	Prerequisites	Basics in thermodynamics and fluid mechanics. Students of other subjects (Chemical- and Biological Engineering, Mechanical Engineering, Life Science Engineering, Energy Technology, Computational Engineering) can participate.
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Metrology Master of Science Advanced Optical Technologies 20222
10	Method of examination	Variable Die Prüfung richtet sich nach dem didaktischen Charakter des Moduls und umfasst entweder eine mündliche Prüfung von 30 min oder eine Klausur von 90 min Dauer. Die Entscheidung für eine Prüfungsform wird in Semestern, in denen die Lehrveranstaltungen stattfinden, spätestens zwei Wochen nach Vorlesungsbeginn in der Lehrveranstaltung und in der StudOn-Gruppe bekannt gegeben. In Semestern, in denen keine Lehrveranstaltungen stattfinden, wird die Prüfungsform spätestens zwei Monate vor der Wiederholungsprüfung in der StudOn-Gruppe bekannt gegeben. The examination depends on the didactic character of the module and comprises either an oral examination of 30 minutes or a written examination of 90 minutes. In semesters in which the courses take place, the decision on the type of examination will be announced in the course and in the StudOn group no later than two weeks after the start of lectures. In semesters in which no courses take place, the type of examination will be announced in the StudOn group no later than two months before the re-examination.

4	Module coordinator	PD Dr. Alberto Leonardi
5	Contents	The course aims to provide a comprehensive framework for investigation of chemical systems exploiting advanced photon and neutron scattering methods. Control of chemical and physical processes with atomic scale and fast time-resolution requires use of large-scale sources. Moreover, combination of numerical simulations with experiments is inevitable for designing of new materials and chemical processes. The objective of this course is for the student to learn: (i) what technologies are available for research and industry from international laboratories, (ii) how to access these resources, (iii) how numerical simulations can be used for data analysis. Part I: Theory (30%) Basics - Review of Materials crystal structure - X-ray – Matter interactions (absorption and elastic/inelastic scattering; Auger, etc.) - Scattering Theory (scattering by electron, atom, cell; scattering cross section; form factors) Commercial vs. Large Scale Sources - High energy X-ray and Neutrons (basic properties of X-rays vs. neutrons) - Synchrotron vs. X-ray free-electron-laser vs. neutron (radiation production) - Neutron - Matter interactions (scattering of neutrons; nuclear and magnetic scattering) - Access routes to Large Scale Facilities (project proposal, application process) Part II: Investigation Techniques (40%) Photon scattering for the study of chemical processes - Synchrotron techniques in catalytic science (XRPD, XPDF, XAFS) - Synchrotron techniques for Nanomaterials and Soft Matter Research (SAXS, XPCS) - In situ/operando synchrotron-based X-ray techniques (XRPD, XPDF, XAS, Imaging) Neutron scattering for the study of biological systems - Structure solution of macromolecular systems (SANS) - Macromolecular crystallography (NMX, Single Crystal Diffraction) - Neutron reflectometry (NR) Virtual Experiments - Data based simulation (e.g., Debye scattering equation) - Instrument based simulation (e.g., MC ray-tracing)

		Part III: Applications (30%) Study of condensed matter systems - case study - Mechanism of Crystallization (and growth) of polymers - Spatial and temporal exploration of heterogeneous catalysts. - Study of electrode materials in electrochemical cells during operation (e.g., battery) Study of bio-organic systems - case study - Study of water systems, hydroxyl groups, hydronium ions, etc. - Study of domain mixing - Study of membrane protein structure - Study of hydration and protonation states - Studies of oxidized and reduced forms of the protein Note: the discussion of the subjects during the course may not reflect the sequential order in the outline due to practical reasons (as an example applications are luckily to be presented in direct relation to the corresponding techniques and not as an independent segment of the course).
6	Learning objectives and skills	Students will become familiar with technologies available for industry and research applications at international laboratories, and discuss possibilities, limitations and future developments. Students who successfully participate in this module can: - Understand how scattering techniques are used for characterization of molecular systems, and understand the different type of source (e.g., laboratory X-ray, Synchrotron, Neutron and Neutron TOF) - Apply simulations to support the analysis of neutron and synchrotron scattering data - Identify investigation method and instrument by assessment of material and technique properties. - Collect information on topics of current interest and present the results to the course members orally or in writing - Explain how to access international laboratory resources, and how to support their experimental project proposals.
7	Prerequisites	Fundamentals of general physics

1	Module name 42130	Advanced Laser	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Nicolas Joly
5	Contents	This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse. Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.
6	Learning objectives and skills	Students • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities
7	Prerequisites	None

3	Lecturers	-	

4	Module coordinator	PD Dr. Andreas Erdmann
5	Contents	Semiconductor lithography covers the process of pattern transfer from a mask/layout to a photosensitive layer on the surface of a wafer. It is one of the most critical steps in the fabrication of microelectronic circuits. The majority of semi-conductor chips are fabricated by optical projection lithography. Other lithographic techniques are used to fabricate lithographic masks or new optical and mechanical devices on the micro- or nanometer scale. Innovations such as the introduction of optical proximity correction (OPC), phase shift masks (PSM), special illumination techniques, chemical amplified resist (CAR) materials, immersion techniques have pushed the smallest feature sizes, which are produced by optical projection techniques, from several wavelengths in the early 80ties to less than a quarter of a wavelength nowadays. This course reviews different types of optical lithographies and compares them to other methods. The advantages, disadvantages, and limitations of lithographic methods are discussed from different perspectives. Important components of lithographic systems, such as masks, projection systems, and photoresist will be described in detail. Physical and chemical effects such as the light diffraction from small features on advanced photomasks, image formation in high numerical aperture systems, and coupled kinetic/diffusion processes in modern chemical amplified resists will be analysed. The course includes an in-depth introduction to lithography simulation which is used to devise and optimize modern lithographic processes.
6	Learning objectives and skills	The students • understand the principles of optical projection lithography • understand how optical and material-driven resolution enhancements work • get an introduction to Extreme Ultraviolet (EUV) lithography • get an overview on alternative lithographic techniques • get an introduction to computational lithography • discuss the role of nanoscale light scattering effects
7	Prerequisites	• Basics of optics and electrical engineering
8	Integration in curriculum	semester: 1

5	Contents	The targeted audience is master level students who are interested in expanding their theoretical and practical knowledge in the field of solid state laser engineering. Introduction to physical phenomena used in development of modern solid state lasers Practical approaches used in design of solid state lasers Introduction to modeling and simulation of the lasing process Modeling of basic solid state laser performance using a commercial software package Practical familiarization with various optical, opto-mechanical, and opto-electrical components used in solid state laser
6	Learning objectives and skills	The students gain the following competences: Setting up basic modeling of a solid state laser using ASLD software Be able to apply modeling for evaluation of performance of a basic laser system Apply basic optimization of the laser system model Identification of an appropriate laser system for a given application Performing basic characterization of laser beam output parameters Enhanced understanding of the laser physics Familiarization with modern design approaches used in solid state laser engineering Improved understanding of linear and nonlinear effects relevant for linear and nonlinear laser beam propagation;
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material Processing Master of Science Advanced Optical Technologies 20222
10	Method of examination	Portfolio - In order to pass the course, all participants are supposed to write a short paper (approx. 6-8 pages) on an assigned subject (60% weight with respect to the overall grade) and give a presentation (approx. 12 minutes) based on this paper (40% weight with respect to the overall grade). - As the circumstances require the oral presentation may be held in a digital manner (e.g. using ZOOM videochat).
11	Grading procedure	Portfolio (100%)
12	Module frequency	Only in summer semester
13	Resit examinations	The exams of this moduls can only be resit once.

14	Workload in clock hours	Contact hours: 30 h Independent study: 45 h
15	Module duration	1 semester
16	Teaching and examination language	english
17	Bibliography	

1	Module name 95360	Lasersystemtechnik I: Hochleistungslaser für die Materialbearbeitung: Bauweisen, Grundlagen der Strahlführung und –formung, Anwendungen Laser system technology I: High-power lasers for material processing: designs, basics of beam guidance and shaping, applications	2,5 ECTS
2	Courses / lectures	Vorlesung: Hochleistungslaser für die Materialbearbeitung - Bauweisen, Grundlagen der Strahlführung und –formung, Anwendungen (2 SWS)	-
3	Lecturers	Prof. Dr. Peter Hoffmann	

4	Module coordinator	Prof. Dr. Peter Hoffmann
5	Contents	• Einführung: Weltmarkt für Lasersysteme, Strahlquellen und deren Anwendung in der Materialbearbeitung • Grundlagen zur Ausbreitung und Fokussierung von Laserstrahlung • CO₂-Lasieranlagen: Strahlerzeugung, Bauformen für Strahlquellen, Strahlführung und formung, Anlagenbeispiele, Anwendungen • Festkörper-Lasieranlagen: Strahlerzeugung, Bauformen, Strahlführung über Lichtleitkabel, Strahlformung, Anlagenbeispiele, Anwendungen • Hochleistungsdioden-Lasieranlagen: Strahlerzeugung, Strahlführung und formung, Anlagenbeispiele, Anwendungen • Neuere Entwicklungen bei Strahlquellen und Lasieranlage • Introduction: Global Market for Laser Systems, Beam Sources and their application in material processing • Fundamentals of Propagation and Focussing of laser radiation • CO₂-Laser Systems: Beam Generation, design of beam sources, beam guidance and shaping, examples of systems, Applications • Solid-State-Laser Systems: Beam Generation, design, beam guidance via light conducting cable, beam shaping, examples of systems, Applications • High-Power-Diode-Laser Systems: Beam Generation, beam guidance and shaping, examples of systems, Applications • Novel developments in beam sources and Laser Systems
6	Learning objectives and skills	Die Studierenden können den Weltmarkt für Lasersysteme, Strahlquellen und deren Anwendung in der Materialbearbeitung korrekt beschreiben. Die Grundlagen zur Ausbreitung und Fokussierung von Laserstrahlung werden so weit beherrscht, dass die Lernenden im Rahmen der geometrischen Optik überschlagsweise die Auslegung von Anlagen berechnen können. Bauformen für CO ₂ -Strahlquellen Strahlführung und formung können die Lernenden skizzieren. Sie erläutern sicher die Anwendungen für Anlagen mit Festkörperlasern, deren Bauformen, die Strahlerzeugung, -führung über Lichtleitkabel und formung. Das Prinzip der Strahlerzeugung in Hochleistungsdiodenlasern können lernende darstellen, ebenso wie dafür geeignete Systeme

		zur Strahlführung, -formung und Anwendungen mit dazugehörigen Anlagenbeispielen. Die Lernenden können über neueste Entwicklungen bei Strahlquellen und Laseranlagen berichten.
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material Processing Master of Science Advanced Optical Technologies 20222
10	Method of examination	Oral mündliche Prüfung, Dauer (in Minuten): 20
11	Grading procedure	Oral (100%)
12	Module frequency	Only in winter semester
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: 30 h Independent study: 45 h
15	Module duration	1 semester
16	Teaching and examination language	german
17	Bibliography	

1	Module name 97150	Lasertechnik / Laser Technology Laser technology	5 ECTS
2	Courses / lectures	Vorlesung: Laser Technology (4 SWS)	5 ECTS
3	Lecturers	Dr. Kristian Cvecek	

4	Module coordinator	Dr. Kristian Cvecek
5	Contents	- Physical phenomena applicable in Laser Technology: EM waves, Beam Propagation, Beam Interaction with matter - Fundamentals of Laser Technology: Principals of laser radiation, types and theoretical understanding of various types of lasers - Laser Safety and common applications: Metrology, Laser cutting, Laser welding, Surface treatment, Additive Manufacturing - Introduction to ultra-fast laser technologies - Numerical exercises related to above mentioned topics - Demonstration of laser applications at Institute of Photonic Technologies (LPT) and Bavarian Laser Centre (blz GmbH) - Possible Industrial visit (e.g. Trumpf GmbH, Stuttgart) - Optional: invited lecture about a novel laser application
6	Learning objectives and skills	The student would know the fundamental principles involved in the development of lasers. will understand the design and functionality of various types of lasers, and be able to comprehend laser specifications. will be able to design and analyse a free space laser beam propagation setup. will gain knowledge about basic optical components used in laser setups such lenses, mirrors, polarizers, etc. would be able to understand the basic interaction phenomena during laser-matter interaction processes. would be able to determine the advantages and disadvantages of using laser process for industrial applications. will know and be able to apply the safety principles while handling laser setups. will be familiar with several most common industrial application of laser for material processing such as cutting, welding, material ablation, additive manufacturing. will be familiar with metrological applications of lasers. will become familiar with and be able to use international (English) professional terminology.
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material Processing Master of Science Advanced Optical Technologies 2022
10	Method of examination	Written examination (120 minutes)

11	Grading procedure	Written examination (100%)

3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	Das Modul behandelt spezialisiert medizintechnische Anwendungen der Photonik. Zunächst wird die Lichtausbreitung in biologischem Gewebe beschrieben und diskutiert. Ein weiterer Abschnitt behandelt die Wechselwirkung zwischen Licht und Gewebe, wobei die einzelnen Wechselwirkungsmechanismen auch an Beispielen der medizintechnischen Praxis vertieft werden. Hier sind stellvertretend zu nennen: Photodynamische Therapie, Photokoagulation, Laser-in-situ-Keratomeileusis (LASIK). Ein weiterer Themenschwerpunkt ist die Diskussion entsprechender diagnostische Verfahren. Hier wird beispielsweise aus spektroskopische Verfahren und auf Diagnoseverfahren die auf Fluoreszenz basieren detailliert eingegangen. Entsprechende Konzepte von Diagnosegeräten wie Endoskope, konfokale Mikroskope, Optische Kohärenztomographie (OCT), faserbasierte Sensoren und Biochipsensoren werden in einem weiteren Abschnitt vertieft. Ein aktueller Forschungsbezug wird im letzten Kapitel, das photonische Systeme in der Ophthalmologie behandelt, hergestellt. Die Lehrveranstaltung des Moduls teilt sich auf in einen Vorlesungsteil sowie einen Übungsteil, in dem die Studierenden durch eigene Beiträge (angeleitete Literaturrecherche, Kurzvorträge und Praxisprojekte) die Inhalte der Vorlesung vertiefen.
6	Learning objectives and skills	Die Studierenden • besitzen spezialisiertes und vertieftes Wissen der medizintechnische Anwendungen der Photonik, insbesondere der im Inhalt genannten Themengebiete. • können technische und wissenschaftliche Anwendungen der Photonik diskutieren, beurteilen und vergleichen. • sind in der Lage, ihre theoretischen Kenntnisse zur Photonik und Lasertechnik im Bereich der Medizintechnik vergleichend einzusetzen und so neue Verfahren und Konzepte zu entwickeln und auszuarbeiten. • können eigenständige Ideen und Konzepte zur Lösung wissenschaftlicher und technischer Probleme der Medizintechnik mit photonischen Systemen entwickeln.
7	Prerequisites	*Voraussetzungen:* • Für Studenten im Master-Studium.

		• "Photonik 1", oder anderweitig erworbene fundierte Kenntnisse im Bereich Optik, Photonik und Lasertechnik.

5	Contents	In der Vorlesung werden fortgeschrittene Techniken der Magnetresonanztomographie (MRT) erklärt. Vorausgesetzt werden Kenntnisse über Grundlagen des Gebietes, wie sie z.B. in der Vorlesung Magnetic resonance imaging 1" behandelt werden (Blochgleichungen, T1- und T2-Wichtung, Schichtselektion, k-Raum-Kodierung). U.a. folgende Themen werden behandelt: Echoplanare Bildgebung; Bildgebung des Flusses, der Perfusion, der Diffusion, der magnetischen Suszeptibilität; funktionelle MRT; Ultrahochfeld-MRT; CEST-Bildgebung; MRT-Technik; Beschleunigungsverfahren, z.B. parallele Bildgebung; Angiographie; Bewegungskompensation. The lecture covers advanced topics in magnetic resonance imaging (MRI). Knowledge about the basic principles of MRI are required as they are covered in the lecture Magnetic Resonance Imaging 1" (Bloch equations, T1 and T2 weighting, slice selection, k-space encoding). I.a. the following topics will be treated: echo planar imaging; imaging of flow, perfusion, diffusion, magnetic susceptibility; functional MRI; ultrahigh field MRI; chemical exchange saturation transfer imaging; MRI technique; acceleration methods, e.g. parallel imaging; angiography; motion compensation.
6	Learning objectives and skills	The participants • understand the principles, properties and limits of advanced MRI techniques • develop the ability to adapt basic principles of MRI to advanced MRI techniques • are able to explain MRI techniques, algorithms and concepts of the lecture to other engineers.
7	Prerequisites	None
8	Integration in curriculum	semester: 1

4	Module coordinator	Prof. Dr. Frederik Bernd Laun
5	Contents	In this module, the physical and technical basics of MRI are taught in detail. The principles of data acquisition are explained and various examples are shown. Imperfections in the data acquisition lead to image artifacts that cannot be avoided in all cases. Strategies for detecting and avoiding image artifacts are explained. One of the great strengths of MRI in medical diagnostics is the ability to acquire images with different contrasts. The origin of the frequently used T1 and T2 weighted image contrasts is discussed in detail. Various MRI sequence techniques are also discussed."
6	Learning objectives and skills	The participants • understand the principles, properties and limits of basic MRI techniques • develop the ability to choose an appropriate basic MRI sequence and to set up the corresponding sequence parameters for a range of basic applications • are able to explain MRI techniques, algorithms and concepts of the lecture to other engineers.
7	Prerequisites	None
8	Integration in curriculum	semester: 1

3	Lecturers	Prof. Dr. Nicolas Joly	

4	Module coordinator	Prof. Dr. Maria Chekhova Dr. Hanieh Fattahi Prof. Dr. Nicolas Joly
5	Contents	The goal of this lecture is to explore advanced concepts of nonlinear optics and their applications. This will cover the following topics: - Nonlinear propagation in solid-core photonic crystal fibres (modulation instability, four-wave mixing, soliton dynamics, supercontinuum generation) and in hollow-core photonic crystal fibres (generation of tunable dispersive waves, plasma in fibres) - Nonlinear optical effects (parametric down-conversion, four-wave mixing, modulation instability) for the generation of nonclassical light (entangled photons, squeezed light, twin beams, heralded single photons). - Nonlinear effects for generating high energy sub cycle pulses (kerr-lens mode-locking, Yb:YAG laser technology, optical parametric amplification, pulses synthesis, attosecond pulse generation)
6	Learning objectives and skills	The student will be able - to choose the most appropriate optical fibre (microstructured or not, solid-core or gas-filled hollow-core) for generating a supercontinuum or pair of sidebands for a dedicated experiment - to design the appropriate tapered optical fibre to obtain an efficient nonlinear process - to use nonlinear optical effects for generating non-classical light, such as photon pairs or squeezed light; - to understand how nonlinear optics works at nanoscale.
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 2022 Optics in Communication Master of Science Advanced Optical Technologies 2022 Physics of Light Master of Science Advanced Optical Technologies 2022
10	Method of examination	Oral (30 minutes)
11	Grading procedure	Oral (100%)
12	Module frequency	Irregular
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h

14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	

1	Module name 67145	Waveguides, optical fibres and photonic crystal fibres	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Waveguides, optical fibres and photonic crystal fibres (4 SWS)	5 ECTS
3	Lecturers	Prof. Dr. Nicolas Joly Prof. Dr.-Ing. Bernhard Schmauß	

4	Module coordinator	Prof. Dr. Nicolas Joly Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	1) Fundamental of waveguides (Guidance mechanism, modes and dispersion, geometrical and electromagnetic approach) 2) Photonic crystal fibres (PCF) 3) Nonlinear optics in PCF (soliton, supercontinuum generation, nonlinear optics in gases in hollow-core PCF) 4) Optical communication systems (system outline, waveguide components, transmission effects, performance limitations) 5) Optical fibre sensors: fibre sensing principles, waveguide-based sensing component, distributed sensing, sensor, network, sensor signal processing)
6	Learning objectives and skills	The students will be able - to identify a particular type of microstructure fibre for a dedicated experiment - to calculate the mode content supported by a specific fibre and model the modal properties - to evaluate the potential limitations of an optical fibre due to nonlinear effects - to choose the appropriate fibre (dispersion and nonlinearity) to generate quiet or very broad supercontinuum spectral using a photonic crystal fibre - to choose the appropriate type of fibre-based sensor according to the signal to probe - to understand the performance limitation of the telecommunications systems
7	Prerequisites	None
8	Integration in curriculum	semester: 1

5	Contents	Optical data transmission systems are the enabler for our modern communication networks. Since the first systems have been installed, the transmission capacity as well as the transmission distance has been increased dramatically. The migration from point-to-point transmission systems to complex optical networks is still in progress. The fast evolution of optical transmission technology is stimulated by innovations in the field of the system key components. The lectures concentrate on the physical effects and properties of key components like semiconductor lasers, optical modulators, optical fibers, optical amplifiers and detector diodes. Especially also the nonlinear effects of the transmission fiber are discussed. The main focus is on the effects and characteristics which are important to achieve a certain system performance. The influence of component parameters on system performance is presented in examples related to installed systems and systems that are actually in development. The exercises partly use a numerical simulation tool to analyze the component influence on system performance.
6	Learning objectives and skills	Students • Understand structure and operation of components of optical communication systems • Rate the optical properties of components and evaluate the influence of operational parameters on system performance • Are able to analyze the influence of linear and nonlinear fiber effects on optical signals and system performance • Can make use of system simulation tools to engineer optical links
7	Prerequisites	Recommended prior knowledge: • Semiconductor physics • Ray optics • Photonics
8	Integration in curriculum	semester: 1

5	Contents	Contents: • Linear properties of materials. • Origin of the nonlinear susceptibility. • Importance of phase-matching. • Second harmonic generation, derivation of the set of coupled equations. • Importance of the initial phase and case of seeding second harmonic generation. Use of birefringence to achieve phase-matching. • Electro-optic effects. • Nonlinear process in relation to third order nonlinearity. • Modulation instability, soliton formation, perturbations of soliton, and supercontinuum generation. • Application: nonlinear optics in photonic crystal fibers.
6	Learning objectives and skills	The students will be able • to derive the equations yielding the conversion efficiency of a nonlinear process based on either χ^2 or χ^3 material • to properly choose the right type of material for the best conversion efficiency in case of second-harmonic, sum-frequency or different frequency • to calculate the phase-matching condition that yields efficient nonlinear effect either using a crystal or an optical fibre • to design a parametric amplifier, phase-sensitive or phase insensitive; • to use nonlinear optical effects for the frequency conversion.

5	Contents	Please check StudOn for registration and further information: Link to StudOn-Entry Nowadays, microcontrollers are the centerpieces of electronics in almost any device, including washing machines, vending machines, several parts of any car and, increasingly, in smart home applications. With processor, memory and peripherals in one chip, they represent a full-fledged computer in miniature, and some of them can be bought for just a few cents. This is why these controllers are very relevant for scientists as well. Specially in research laboratories, individual and quick solutions for controlling mechanics and devices for data logging are highly desired. A very suitable introduction to working with microcontrollers is the Arduino platform. With standardized hardware boards and its own development environment based on the programming language C, the main focus of Arduino is on the rapid realization of new and individual projects. Numerous code libraries and compatible hardware extensions such as WIFI boards, SD card slots, various sensors, smartphone interaction and much more enable complex projects even for beginners. The scope of the two-week course “Arduino hard- and software for lab applications and beyond” reaches from the understanding of basic hardware components and electronics to the implementation of a multitude of libraries and modules. In addition to theoretical lectures, each group of two to three students will work on hard- and software every day. In the last few days of the course, the students apply their knowledge in an own project of their choice. Thereby, first ideas to lab automation can be implemented.
6	Learning objectives and skills	The students gain sound qualification in designing and realizing complex hard- and software projects using microcontrollers based on Arduino, including: • Basics of electronics and microcontrollers • Communication of microcontrollers • Analog and digital signals • Finite-state machine • Sensors, modules, shields • Software libraries • Displays

		• Smartphone connection
7	Prerequisites	Most important: Enthusiasm and curiosity about the topic Advantageous, but not mandatory: First experience in programming
8	Integration in curriculum	semester: 1

4	Module coordinator	Prof. Dr. Christoph Marquardt
5	Contents	Inhalt: • Introduction to quantum communication: Motivation and practical impact • Introduction and refresh of fundamentals of quantum mechanics • Basics of information theory • Definition of a quantum state in quantum optics • Fundamental principle of quantum key distribution • Fundamental principle of quantum communication (classical and quantum capacity) • Detailed steps of quantum key distribution • Security proofs (epsilon security) • Modulation of quantum states • Detection of quantum states • Electronics for coherent communication • Error correction codes • Practical implementations • Combination with classical cryptography • Fiber-based systems • Free space and satellite-based systems • Quantum repeaters
6	Learning objectives and skills	The students are learning the foundations of modern quantum communication and study concrete examples of quantum communication protocols. They should be able to quantitatively solve fundamental problems and understand scientific articles in the field. The lecture will introduce the foundations and aspects of implementation of quantum key distribution protocols. It will introduce experimental requirements and real-world applications and highlight interfaces to classical communication and cryptography.
7	Prerequisites	None

5	Contents	The goal of this course is to furnish the students the main conceptual and calculation tools, used in typical theoretical research projects in quantum optics. These tools include operators algebra at increasing level of complexity for the study of single- and multimode states of the electromagnetic field, elementary concepts of group theory, some probability and random variable theory, and functional methods in quantum optics (mainly functional derivatives and path integration).
6	Learning objectives and skills	At the end of the lectures the students will be able to read and understand theoretical research papers in quantum optics, and to apply the learned concepts to their own future research.
7	Prerequisites	The course is targeted to MSc students since the main topic is "advanced quantum optics". It is assumed that students were already exposed to the quantization of the electromagnetic field. However, only knowledge of the elementary quantization of the transverse field in the Coulomb gauge is required to understand the lectures.
8	Integration in curriculum	no Integration in curriculum available!

5	Contents	Keywords: Introduction to experimental systems for quantum information processing (QIP). Quantum bits. Quantum Computing. Coherent Control. Measurement. Decoherence. Microscopic and macroscopic quantum systems. Trapped Ions, Rydberg Atoms, Photons, Quantum Dots, NV centers, Superconducting Circuits. During the past 20 years quantum physics has entered the domain of information technology in increasingly profound ways. Rapid progress in the physical sciences and in engineering and technology has allowed us to build information processing devices, which utilize the laws of quantum physics. In these processors information is stored in quantum states rather than classical states. As such the the superposition principle and entanglement can be exploited as new resources for processing, storing and protecting information. Information processors using quantum physics are expected to become potentially more powerful than their classical counterparts. Developments in this research field are driven by academic labs, startups and major industrial cooperations. The goal of this course is to provide a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics. Introduction to experimental systems for quantum information processing (QIP). - Quantum bits - Coherent Control - Measurement - Decoherence - DiVincenzo criteria QIP with - Ions - Superconducting Circuits - Photons - NMR - Rydberg atoms - NV-centers

		- Quantum dots

5	Contents	This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse. Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.
6	Learning objectives and skills	Students • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities

5	Contents	Semiconductor lithography covers the process of pattern transfer from a mask/layout to a photosensitive layer on the surface of a wafer. It is one of the most critical steps in the fabrication of microelectronic circuits. The majority of semi-conductor chips are fabricated by optical projection lithography. Other lithographic techniques are used to fabricate lithographic masks or new optical and mechanical devices on the micro- or nanometer scale. Innovations such as the introduction of optical proximity correction (OPC), phase shift masks (PSM), special illumination techniques, chemical amplified resist (CAR) materials, immersion techniques have pushed the smallest feature sizes, which are produced by optical projection techniques, from several wavelengths in the early 80ties to less than a quarter of a wavelength nowadays. This course reviews different types of optical lithographies and compares them to other methods. The advantages, disadvantages, and limitations of lithographic methods are discussed from different perspectives. Important components of lithographic systems, such as masks, projection systems, and photoresist will be described in detail. Physical and chemical effects such as the light diffraction from small features on advanced photomasks, image formation in high numerical aperture systems, and coupled kinetic/diffusion processes in modern chemical amplified resists will be analysed. The course includes an in-depth introduction to lithography simulation which is used to devise and optimize modern lithographic processes.
6	Learning objectives and skills	The students • understand the principles of optical projection lithography • understand how optical and material-driven resolution enhancements work • get an introduction to Extreme Ultraviolet (EUV) lithography • get an overview on alternative lithographic techniques • get an introduction to computational lithography • discuss the role of nanoscale light scattering effects
7	Prerequisites	• Basics of optics and electrical engineering

5	Contents	• Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik • Gleichgewichtseigenschaften zur Charakterisierung von Arbeitsstoffen, z.B. in Form der thermodynamischen Zustandseigenschaften und -größen Dichte, innere Energie, Enthalpie, Entropie, spezifische Wärmekapazität, Schallgeschwindigkeit, Brechungsindex, Oberflächen- und Grenzflächenspannung • Transporteigenschaften zur Charakterisierung des molekularen Masse-, Energie- und Impulstransportes, z.B. Viskosität, Diffusionskoeffizient, Soret-Koeffizient, Thermodiffusionskoeffizient, Wärme- und Temperaturleitfähigkeit • Anwendungsbezogene Stoffdatenrecherche in der wissenschaftlichen Literatur, Tabellenwerken und Datenbanken • Korrelationen und Vorhersagemethoden für Stoffeigenschaften • Methoden zur experimentellen Bestimmung und prozessbegleitenden Messung von Stoffdaten, insbesondere durch moderne laseroptische Techniken • Grundzüge der theoretischen Bestimmung von Stoffdaten mit Hilfe der molekularen Modellierung • Aufstellung von thermischen und kalorischen Zustandsgleichungen *Content* • The importance of thermophysical properties in process and energy engineering • Equilibrium properties for the characterization of working materials, e.g., in the form of thermodynamic properties of state and other equilibrium properties such as density, internal energy, enthalpy, entropy, specific heat capacity, sound speed, refractive index, surface or interfacial tension, etc. • Transport properties for the characterization of molecular transfer of mass, energy, and momentum, e.g. diffusion coefficients, Soret coefficient, thermal diffusion coefficient, thermal conductivity, thermal diffusivity, and viscosity • Use-oriented inquiry of thermophysical property data in scientific literature, table compilations, and databases

		• Correlation and prediction of thermophysical properties • Methods for experimental determination and in-process measurement of thermophysical properties, in particular by laser-optical techniques • Basics of the theoretical prediction of thermophysical properties by molecular modeling • Development of thermal and caloric equations of state
6	Learning objectives and skills	Die Studierenden • sind mit der Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik in Form von Gleichgewichts- und Transporteigenschaften vertraut, • verwenden verschiedene Bezugsquellen für Stoffeigenschaften (Recherche in wissenschaftlicher Literatur, Tabellenwerken und Datenbanken; Korrelationen und Vorhersagemethoden; theoretische und experimentelle Bestimmung) eigenständig und wählen diese bedarfsgerecht und abhängig vom resultierenden Nutzen und Aufwand aus, • kennen die Herangehensweisen zur Korrelation und Vorhersage von Stoffeigenschaften sowie zur Aufstellung von thermischen und kalorischen Zustandsgleichungen und übertragen diese Herangehensweisen auf andere Stoffe, • sind mit experimentellen Methoden zur Stoffdatenbestimmung vertraut, insbesondere mit laseroptischen Messtechniken, • verstehen die Grundzüge der molekularen Modellierung zur theoretischen Bestimmung von Stoffdaten und • wählen Arbeitsmedien mit definierten Stoffeigenschaften für eine optimierte Gestaltung von Verfahren und Prozessen der Energie- und Verfahrenstechnik aus. *Education objectives and competences* The students • are aware of the importance of thermophysical properties in process and energy engineering in the form of equilibrium and transport properties, • use various sources for thermophysical properties (scientific literature, table compilations, databases, correlations, predictions, theoretical and experimental determination) independently and select the respective sources in a use-oriented way considering the resulting effort and benefit, • know the approaches for the correlation and prediction of thermophysical properties as well as for developing equations of state, and are able to transfer these approaches to other systems, • are familiar with experimental methods for the determination of thermophysical properties, in particular with laser-optical methods, • understand the basics of the use of molecular modeling for the theoretical determination of thermophysical properties,

		select working materials with defined thermophysical properties for an optimized design of processes in energy and process engineering.
7	Prerequisites	Grundkenntnisse der Technischen Thermodynamik sowie der Wärme-, Stoff- und Impulsübertragung Basic knowledge on engineering thermodynamics as well as heat, mass, and momentum transfer
8	Integration in curriculum	semester: 1

1	Module name 46257	Advanced Semiconductor Technologies Photovoltaic Systems I - Fundamentals Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Advanced Semiconductor Technologies - Photovoltaic Systems for Power Generation - Design Implementation and Characterization (2 SWS) Tutorium: Questionnaire PV Systems 1	3 ECTS -
3	Lecturers	Dr. Larry Lüer Prof. Dr. Christoph Brabec	

4	Module coordinator	Prof. Dr. Christoph Brabec Prof. Dr. Wolfgang Hei
5	Contents	Lecture / Exercise / Lab work The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.
6	Learning objectives and skills	- The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. - Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.
7	Prerequisites	Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, or comparable
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 20222
10	Method of examination	Variable

		Advanced Semiconductor Technologies – Photovoltaic Systems I - Fundamentals (Prüfungsnummer: 62571) Examination performance, oral examination, duration (in minutes): 15, graded, 5 ECTS Share in the calculation of the module grade: 100.0% Alternative examination forms: written exam (90 min). Choice of the examination form is done on the basis of the didactic character of the module. The decision for the examination form will be communicated: • in semesters where the lecture takes place: no more than two weeks after lecture start in the lecture and in the StudOn group • in semesters without lecture: at least two weeks before the repetition exam in the StudOn group
11	Grading procedure	Variable (100%) Advanced Semiconductor Technologies – Photovoltaic Systems I - Fundamentals (examination number: 62571) Share in the calculation of the module grade: 100.0 %
12	Module frequency	Only in winter semester
13	Workload in clock hours	Contact hours: 40 h Independent study: 110 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	

1	Module name 67145	Waveguides, optical fibres and photonic crystal fibres	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Waveguides, optical fibres and photonic crystal fibres (4 SWS)	5 ECTS
3	Lecturers	Prof. Dr. Nicolas Joly Prof. Dr.-Ing. Bernhard Schmauß	

4	Module coordinator	Prof. Dr. Nicolas Joly Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	1) Fundamental of waveguides (Guidance mechanism, modes and dispersion, geometrical and electromagnetic approach) 2) Photonic crystal fibres (PCF) 3) Nonlinear optics in PCF (soliton, supercontinuum generation, nonlinear optics in gases in hollow-core PCF) 4) Optical communication systems (system outline, waveguide components, transmission effects, performance limitations) 5) Optical fibre sensors: fibre sensing principles, waveguide-based sensing component, distributed sensing, sensor, network, sensor signal processing)
6	Learning objectives and skills	The students will be able - to identify a particular type of microstructure fibre for a dedicated experiment - to calculate the mode content supported by a specific fibre and model the modal properties - to evaluate the potential limitations of an optical fibre due to nonlinear effects - to choose the appropriate fibre (dispersion and nonlinearity) to generate quiet or very broad supercontinuum spectral using a photonic crystal fibre - to choose the appropriate type of fibre-based sensor according to the signal to probe - to understand the performance limitation of the telecommunications systems
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 20222 Optics in Communication Master of Science Advanced Optical Technologies 20222
10	Method of examination	Oral (30 minutes)
11	Grading procedure	Oral (100%)

1	Module name 46228	Glas I Glass I	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Vibrational spectroscopies, from theory to practice (2 SWS) Vorlesung mit Übung: Optical properties of glasses (2 SWS)	2,5 ECTS 2,5 ECTS
3	Lecturers	Prof. Dr. Dominique de Ligny	

4	Module coordinator	Prof. Dr. Dominique Ligny
5	Contents	Optical properties of glasses • Fundamental concepts: The electromagnetic spectrum and units, Absorption, Luminescence, Scattering • Optical transparency of solids: Optical magnitudes and the dielectric constant, The Lorentz Oscillator, Metals, Semiconductors and insulators, Excitons, Reflection and polarization • Optical glasses: Optical aberration and solutions, Dispersion properties and composition • Colors in glasses: The eye, Optically Active Centers, Transition metals in glasses, Metallic and Chalcogenide nanoparticles • Chromism: Thermochromism, Photochromism, Gasochromism, Electrochromism • IR glasses: Chalcogenide, Fluorite glasses • Optical Fibers: Principle, Manufacturing, Applications, Photonic fibers Vibrational spectroscopies, from theory to practice • Nature of vibrations inside matter • Interaction light matter • Instrumentation • Raman application • Infrared Spectroscopy • Advanced technics
6	Learning objectives and skills	Spectroscopy techniques applied to amorphous materials The students will • Understand the solid state physic background link to the optical properties of all type of materials • Be able to explain the different ways to create colors • Choose the appropriate glass compositions to realize optical device in the infrared region • Have an overview of the different technologies link to light management • Know the different parameters that define an Optical glass fiber and choose them in regard of the attended application Vibrational spectroscopies, from theory to practice The student will • Understand in a comprehensive way the solid state physic background link to these spectroscopies

		• Know the different parts of a spectrometer and their characteristic parameter • Exercise himself to set the parameters of an observation and run the measurements • Treat the data by applying the needed corrections • Evaluate the data using peak fitting, momentum calculations and Principal Component Analysis • Deduce information on the structure of common glasses
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 20222 Optical Metrology Master of Science Advanced Optical Technologies 20222

5	Contents	Glass formulation using project management: Intensive exercise of 6 half days at the end of the semester. The teaching follows an "on time approach. After presentation of the case study, an introduction to the project management is given. Analytical tools are given to the students than can use them directly on the case study. The project is then defined through brainstorming followed by Solution analysis and quotation. The rules for scheduling, monitoring and controlling a project are introduced before the case study is started to be solved. An emphasis is given on reporting by quick presentation at the end of each half day by the project team. In conclusion a last time is taken to analyze the personal issues encounter during these six half days. That help the students to have a pragmatic thinking about what could have been a better project team and the need of a leader. Glass and Ceramic for Energy-technology: • Materials and energy • Solar Energy • Solar Thermal • Photovoltaic Energy • Insulation • Wind Energy • Nuclear waste glass storage • Energy in glass processing • Fuel Cell and Ion conductivity • Lighting LED and LASER REE technology
6	Learning objectives and skills	Glass formulation using project management The student will • Learn the different concept used in project management as well as its specific vocabulary • Practice the project management in a small team • Use the different tools of project management • Go from an application to the conception of a product Glass and Ceramic for Energy-technology The student will • Understand the global environmental issues related to the use of glasses for: • Nonrenewable energy sources • Renewable energy sources • Energy efficiency • Energy storage

		• Know the improvement needed in the future • Look for solution by linking the expected performance to the glass properties • Be able to choose the good glass composition, production and shaping processes
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Optical Material and Systems Master of Science Advanced Optical Technologies 20222

3	Lecturers		

4	Module coordinator	PD Dr.-Ing. Miroslaw Batentschuk	
5	Contents	The module consists of a lecture and a lab course: - Phosphors for Light Conversion in Photovoltaic Devices and LEDs (Im Wintersemester) (Vorlesung, 2 SWS, Miroslaw Batentschuk - Lab Work Manufacturing and Characterization of Phosphors and Storage Phosphors (im Sommersemester) (Praktikum, 3 SWS, Andres Osvet et al., Zeit n. V., Labore LS i-MEET) ; Scope: 1 experiment, 20 pages report. Contents: - Classification of phosphors according to their principle of operation and by field of application. - Establishing the relationships between crystal structure of phosphors as well as their composition and the desirable absorption and emission properties. - Energy transfer between the crystal lattice and active ions as well as between these ions - Consideration of several examples - Theoretical analysis of phosphor engineering with the purpose to reach maximal energy efficiency during transformation of the ionizing radiation - Basics and to methods of storage phosphor manufacturing - Analysis of requirements to the properties and new trends in development of phosphors for white light emitting diodes and for adaptation of the sun light spectrum to the sensitivity of solar cells and plants	
6	Learning objectives and skills	- The students will get the theoretical background and the ability to determine the required parameters for engineering new phosphors as a part of photovoltaic modules and devices for modern lighting. - The students will be trained in processing of phosphors and dielectric layers. The students will gain knowledge in characterization of phosphors and improved solar cells.	
7	Prerequisites	- Bachelor in Material Science, - Bachelor in Nanotechnologie / Nanotechnology, - Bachelor in Energietechnik / Energy Technology, - Bachelor in Elektrotechnik / Electronic Engineering, - Bachelor in Computer Science,	

		• Bachelor in Physik / Physics, • Bachelor in Chemie / Chemistry • Bachelor in Chemical Engineering • or comparable

5	Contents	The goal of this lecture is to explore advanced concepts of nonlinear optics and their applications. This will cover the following topics: - Nonlinear propagation in solid-core photonic crystal fibres (modulation instability, four-wave mixing, soliton dynamics, supercontinuum generation) and in hollow-core photonic crystal fibres (generation of tunable dispersive waves, plasma in fibres) - Nonlinear optical effects (parametric down-conversion, four-wave mixing, modulation instability) for the generation of nonclassical light (entangled photons, squeezed light, twin beams, heralded single photons). - Nonlinear effects for generating high energy sub cycle pulses (kerr-lens mode-locking, Yb:YAG laser technology, optical parametric amplification, pulses synthesis, attosecond pulse generation)
6	Learning objectives and skills	The student will be able - to choose the most appropriate optical fibre (microstructured or not, solid-core or gas-filled hollow-core) for generating a supercontinuum or pair of sidebands for a dedicated experiment - to design the appropriate tapered optical fibre to obtain an efficient nonlinear process - to use nonlinear optical effects for generating non-classical light, such as photon pairs or squeezed light; - to understand how nonlinear optics works at nanoscale.

1	Module name 43386	Computational Photography and Capture Computational photography and capture	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Tim Weyrich
5	Contents	Never in human history have we been able to record so much of our environment in so little time with such high quality. Since the rise of smartphones, nearly everyone carries a powerful camera with them in their daily lives. This module introduces the theoretical and practical aspects of modern photography and capture algorithms: universal models of colour, computer-controlled cameras, lighting and shape capture. The module covers the following topics: • Cameras, sensors and colour • Image processing (e.g., blending, warping) • Radiometry • Appearance acquisition • Structured-light 3D acquisition • Image-based and video-based rendering
6	Learning objectives and skills	The students ... • ... know the basic vocabulary of computational photography • ... understand principles of light transport in natural scenes • ... understand principles of digital image formation • ... understand how computational-photography algorithms can exploit knowledge of these principles to transcend the capabilities of traditional photograph • ... apply image-processing algorithms to analyse and transform images • ... apply acquisition algorithms to capture appearances and 3D scene • ... develop their own software prototypes to capture and process digital images
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Computational Optics Master of Science Advanced Optical Technologies 20222
10	Method of examination	Variable (30 minutes) Die Prüfung richtet sich nach dem didaktischen Charakter des Moduls und umfasst entweder eine mündliche Prüfung von 30 min oder eine Klausur von 60 min Dauer. Die Entscheidung für eine Prüfungsform wird in Semestern, in denen die Lehrveranstaltungen stattfinden, spätestens zwei Wochen nach Vorlesungsbeginn in der Lehrveranstaltung bekannt gegeben. In Semestern, in denen keine Lehrveranstaltungen

		stattfinden, wird die Prüfungsform spätestens zwei Monate vor der Wiederholungsprüfung durch E-Mail an die angemeldeten Prüflinge bekannt gegeben. The concrete form of examination (30 min. oral exam or 60 min. written exam) is defined at the beginning of the semester depending on the didactic character of the class. In semestern when the lecture is held, it will be announced in the lecture non later than 2 weeks after the lecture start. In semestern when the lecture is not held, it will be announced 2 months prior to the repetition exam via email to registered participants.
11	Grading procedure	Variable (100%)

5	Contents	This lecture is the sequel to the lecture "<i>Pattern Recognition</i>". As such, it covers topics from the chapters 8-14 from the book "<i>Pattern Recognition and Machine Learning</i>" by Christopher Bishop. These topics include various aspects of Bayesian modeling, including (but not limited to) • probabilistic graphical models • mixture modeling • variational inference • sampling methods • manifold learning • Markov random fields • hidden Markov models • tree-based methods • ensembling
6	Learning objectives and skills	The students • explain the discussed methods for classification, prediction, and analysis of patterns, • compare and analyze methods for manifold learning and select a suited method for a given set of features and a given problem, • compare and analyze methods for probability density estimation and select a suited method for a given set of features and a given problem, • apply non-parametric probability density estimation to pattern analysis problems, • apply dimensionality reduction techniques to high-dimensional feature spaces, • explain statistic modeling of feature sets and sequences of features, • explain statistic modeling of statistical dependencies
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Computational Optics Master of Science Advanced Optical Technologies 20222
10	Method of examination	Variable (60 minutes) Die Prüfung ist eine schriftliche Klausur mit Multiple Choice mit einer Dauer von 60 Minuten. ---

		The form of examination is a written exam with multiple choice with a duration of 60 minutes.
11	Grading procedure	Variable (100%)
12	Module frequency	Only in summer semester
13	Resit examinations	The exams of this moduls can only be resit once.

5	Contents	This lecture discusses important algorithms from the field of computer vision. The emphasis lies on 3-D vision algorithms, covering the geometric foundations of computer vision, and central algorithms such as stereo vision, structure from motion, optical flow, and 3-D multiview reconstruction. Participants of this advanced course are expected to bring experience from prior lectures either from the field of pattern recognition or from the field of computer graphics.
6	Learning objectives and skills	Die Vorlesung stellt eine Auswahl von Methoden aus dem Gebiet der Computer Vision vor, die in dem Feld eine zentrale Stellung einnehmen. In den Übungen implementieren und evaluieren die Studierenden selbständig diese Methoden. Die Studierenden arbeiten die ganze Zeit über an populären Computer Vision-Methoden wie zum Beispiel Stereosehen, optischer Fluss und 3D-Rekonstruktion aus mehreren Ansichten. Für diese Probleme • beschreiben die Studierenden perspektivische Projektion, Rotationen und verwandte geometrische Grundlagen, • erklären die Studierenden die behandelten Methoden, • diskutieren die Studierenden Vor- und Nachteile verschiedener Modalitäten zur Erfassung von 3D-Informationen, • implementieren die Studierenden einzeln und gemeinschaftlich in Kleingruppen Code, • entdecken die Studierenden optimale Vorgehensweisen in der Datenaufnahme, • erkunden und bewerten die Studierenden unterschiedliche Möglichkeiten für die Evaluation, • diskutieren und präsentieren die Gruppenarbeiter in Gruppen die Vor- und Nachteile ihrer Implementierungen, • diskutieren und reflektieren die Studierenden gesellschaftliche Auswirkungen von Anwendungen des 3D-Rechnersehens. The lecture introduces computer vision algorithms that are central to the field. In the exercises, participants autonomously implement and evaluate these algorithms. The participants work throughout the time on popular computer vision algorithms, like for example stereo vision, optical flow, and 3-D multiview reconstruction. For these problems, the participants • describe perspective projection, rotations, and related geometric foundations, • explain the presented methods, • discuss the advantages and disadvantages of different modalities for acquiring 3-D information,

		• implement individually and in small groups code, • discover best practices in data acquisition, • explore and rank different choices for evaluation, • discuss and present in groups the advantages and disadvantages of their implementations, • discuss and reflect the social impact of applications of computer vision algorithms.

5	Contents	*Contents:* The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.
6	Learning objectives and skills	*Learning goals and competences:* Students • understand the origin of the computation potential of quantum computers • understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm • understand the working principle of quantum error correction and key error correcting codes • code quantum algorithms in a modern quantum programming language • are able to apply the learned methodology to example problems
7	Prerequisites	None
8	Integration in curriculum	semester: 1

5	Contents	How do humans perceive the visual world? How can we build computational models to mimic this human perception? And how can we validate those computational models? This course is designed as an introduction to enable you to build computational models for human visual perception. It will therefore provide an introduction into the human visual system building on the course on cognitive neuroscience for AI developers. You will learn how the human eye and brain process visual input and what we currently know about the ventral visual stream. We will look at computational models for all different levels of visual processing and discuss how well they measure behavioral data. This lecture is designed to be at the intersection of Computer Science (Computer Vision and Graphics) and Cognitive Neuroscience. After an initial introductory phase, you will in small teams (1-3 students) perform a project to build prototypes for computational models for visual processing, reproduce recent scientific results or experiment with existing models. In addition to the project phase we will read and discuss recent research papers studying potential computational models and investigate how we can evaluate computational models. Please sign up via studon	
6	Learning objectives and skills	By the end of this course, students will be able to • Describe the basic processing steps of visual input in the human brain • Build a computational model for a known processing step • Read recent papers in the discipline and design a follow-up experiment • Choose/design and conduct a small research project • Choose adequate methods to evaluate a computational model • Work in and manage projects	
7	Prerequisites	None

5	Contents	<u>What is photonic machine learning and why does it exist?</u> <i>Artificial neural networks</i> (ANNs) have emerged as a powerful tool, which are for example used to accelerate medical research and for language processing. The freedom and power gained through the complexity of ANNs comes with the cost of a computational intense model training, eventually leading to a high energy consumption. For instance, the training of the recently published and much discussed large-language model ChatGPT 4 cost more than 100 million dollars. A reason for those high cost of ANNs is the underlying computing hardware, which is based on a von Neumann architecture, which simplifies means the separation of memory and processing units. As consequence, researchers study more specific beyond von Neumann architectures specifically designed for machine learning and deep learning applications. One possible solution to overcome the current limitations, could be the transfer of electronical ANNs into the optical domain. The resulting <i>optical neural networks</i> (ONNs) have attracted great interest over the last decades due to their promises of high processing speed, broad bandwidth, and low dissipative losses. Especially the collapse of many computational steps into a single process, which is natural in most ONNs, strongly increases the computational efficiency. Thus, ONNs are considered to path the way towards energy efficient and highly parallel optical circuits, which will have a significant impact on the performance and capabilities of future artificial neural networks. Multiple publications have demonstrated the capabilities of ONNs already. <u>What are we going to discuss?</u> The aim of the seminar is to give the audience an overview of the photonic machine learning community. How detailed this overview is, of course, depends on the number of participants. In general, we would select the topics from the following categories: • Optical fully-connected feedforward neural networks • Optical reservoir computing and other extreme learning machines • Photonic neural networks for image classification • Photonic neural networks for language classification, e.g., optical transformers • Limits of photonic neural networks and approaches beyond photonics

6	Learning objectives and skills	Goal of the seminar • Overview of cutting-edge science Participants are exposed to recent developments in photonic machine learning and gain an overview about it. • Presenting science Participants are supported in developing a comprehensive and engaging narrative for presentations • Extracting information Participants will learn to extract relevant information from research papers in preparation for their literature review for their master's thesis. • Organization of information Participants learn to collect, organize and process information from scientific papers
7	Prerequisites	<u>I don't have background in machine learning, can I still participate?</u> We do not expect a deep background in machine learning, however, expect a curious and proactive mentality to explore and learn new and unknown concepts.
8	Integration in curriculum	semester: 1
9	Module compatibility	Computational Optics Master of Science Advanced Optical Technologies 20222
10	Method of examination	Seminar achievement (45 minutes) This seminar explores recent developments in the field of <i>photonic machine learning</i> . Participants will present their topic in a seminar talk (30min) and have a discussion (15-30min) with the audience.
11	Grading procedure	Seminar achievement (100%)

4	Module coordinator	PD Dr. Andrea Aiello
5	Contents	The goal of this course is to furnish the students the main conceptual and calculation tools, used in typical theoretical research projects in quantum optics. These tools include operators algebra at increasing level of complexity for the study of single- and multimode states of the electromagnetic field, elementary concepts of group theory, some probability and random variable theory, and functional methods in quantum optics (mainly functional derivatives and path integration).
6	Learning objectives and skills	At the end of the lectures the students will be able to read and understand theoretical research papers in quantum optics, and to apply the learned concepts to their own future research.
7	Prerequisites	The course is targeted to MSc students since the main topic is "advanced quantum optics". It is assumed that students were already exposed to the quantization of the electromagnetic field. However, only knowledge of the elementary quantization of the transverse field in the Coulomb gauge is required to understand the lectures.
8	Integration in curriculum	no Integration in curriculum available!

4	Module coordinator	Prof. Dr. Nicolas Joly
5	Contents	This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse. Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.
6	Learning objectives and skills	Students • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities

4	Module coordinator	Prof. Dr. Maria Chekhova Dr. Hanieh Fattahi Prof. Dr. Nicolas Joly
5	Contents	The goal of this lecture is to explore advanced concepts of nonlinear optics and their applications. This will cover the following topics: - Nonlinear propagation in solid-core photonic crystal fibres (modulation instability, four-wave mixing, soliton dynamics, supercontinuum generation) and in hollow-core photonic crystal fibres (generation of tunable dispersive waves, plasma in fibres) - Nonlinear optical effects (parametric down-conversion, four-wave mixing, modulation instability) for the generation of nonclassical light (entangled photons, squeezed light, twin beams, heralded single photons). - Nonlinear effects for generating high energy sub cycle pulses (kerr-lens mode-locking, Yb:YAG laser technology, optical parametric amplification, pulses synthesis, attosecond pulse generation)
6	Learning objectives and skills	The student will be able - to choose the most appropriate optical fibre (microstructured or not, solid-core or gas-filled hollow-core) for generating a supercontinuum or pair of sidebands for a dedicated experiment - to design the appropriate tapered optical fibre to obtain an efficient nonlinear process - to use nonlinear optical effects for generating non-classical light, such as photon pairs or squeezed light; - to understand how nonlinear optics works at nanoscale.
7	Prerequisites	None
8	Integration in curriculum	semester: 1

4	Module coordinator	Prof. Dr. Michael Hartmann
5	Contents	*Contents:* The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.
6	Learning objectives and skills	*Learning goals and competences:* Students • understand the origin of the computation potential of quantum computers • understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm • understand the working principle of quantum error correction and key error correcting codes • code quantum algorithms in a modern quantum programming language • are able to apply the learned methodology to example problems
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Computational Optics Master of Science Advanced Optical Technologies 20222 Physics of Light Master of Science Advanced Optical Technologies 20222

Press), "Quantum Computing: A Gentle Introduction by Rieffel and Polak (MIT Press) as well as lecture notes by John Preskill available at http://theory.caltech.edu/~preskill/ph229/ and Ronald de Wolf available at https://homepages.cwi.nl/~rdewolf/qc19.html .

1	Module name 67188	Quantum Communication Quantum communication	5 ECTS
2	Courses / lectures	Hauptseminar: Quantum Communication (2 SWS)	5 ECTS
3	Lecturers		

4	Module coordinator	Prof. Dr. Christoph Marquardt
5	Contents	In this seminar we will introduce and discuss fundamental concepts of quantum communication and talk about recent developments. Topics include: Introduction to quantum information concepts, quantum optics: preparation and measurement of quantum states, concepts of quantum cryptography and the BB84 protocol, quantum key distribution with discrete variables: modern protocols, QKD with continuous variables, modern quantum key distribution security proofs, quantum repeaters, quantum communication with satellites, quantum random number generation
6	Learning objectives and skills	Students • comprehend an interesting physical topic in a short time frame • identify and interpret the appropriate literature • select and organize the relevant information for the presentation • compose a presentation on the topic at the appropriate level for the audience • use the appropriate presentation techniques and tools • criticize and defend the topic in a scientific discussion
7	Prerequisites	None

4	Module coordinator	Prof. Dr. Nicolas Joly
5	Contents	Contents: • Linear properties of materials. • Origin of the nonlinear susceptibility. • Importance of phase-matching. • Second harmonic generation, derivation of the set of coupled equations. • Importance of the initial phase and case of seeding second harmonic generation. Use of birefringence to achieve phase-matching. • Electro-optic effects. • Nonlinear process in relation to third order nonlinearity. • Modulation instability, soliton formation, perturbations of soliton, and supercontinuum generation. • Application: nonlinear optics in photonic crystal fibers.
6	Learning objectives and skills	The students will be able • to derive the equations yielding the conversion efficiency of a nonlinear process based on either χ^2 or χ^3 material • to properly choose the right type of material for the best conversion efficiency in case of second-harmonic, sum-frequency or different frequency • to calculate the phase-matching condition that yields efficient nonlinear effect either using a crystal or an optical fibre • to design a parametric amplifier, phase-sensitive or phase insensitive; • to use nonlinear optical effects for the frequency conversion.

4	Module coordinator	Prof. Dr. Christoph Marquardt
5	Contents	Inhalt: • Introduction to quantum communication: Motivation and practical impact • Introduction and refresh of fundamentals of quantum mechanics • Basics of information theory • Definition of a quantum state in quantum optics • Fundamental principle of quantum key distribution • Fundamental principle of quantum communication (classical and quantum capacity) • Detailed steps of quantum key distribution • Security proofs (epsilon security) • Modulation of quantum states • Detection of quantum states • Electronics for coherent communication • Error correction codes • Practical implementations • Combination with classical cryptography • Fiber-based systems • Free space and satellite-based systems • Quantum repeaters
6	Learning objectives and skills	The students are learning the foundations of modern quantum communication and study concrete examples of quantum communication protocols. They should be able to quantitatively solve fundamental problems and understand scientific articles in the field. The lecture will introduce the foundations and aspects of implementation of quantum key distribution protocols. It will introduce experimental requirements and real-world applications and highlight interfaces to classical communication and cryptography.
7	Prerequisites	None

4	Module coordinator	PD Dr. Andrea Aiello
5	Contents	The goal of this course is to furnish the students the main conceptual and calculation tools, used in typical theoretical research projects in quantum optics. These tools include operators algebra at increasing level of complexity for the study of single- and multimode states of the electromagnetic field, elementary concepts of group theory, some probability and random variable theory, and functional methods in quantum optics (mainly functional derivatives and path integration).
6	Learning objectives and skills	At the end of the lectures the students will be able to read and understand theoretical research papers in quantum optics, and to apply the learned concepts to their own future research.
7	Prerequisites	The course is targeted to MSc students since the main topic is "advanced quantum optics". It is assumed that students were already exposed to the quantization of the electromagnetic field. However, only knowledge of the elementary quantization of the transverse field in the Coulomb gauge is required to understand the lectures.
8	Integration in curriculum	no Integration in curriculum available!

5	Contents	Keywords: Introduction to experimental systems for quantum information processing (QIP). Quantum bits. Quantum Computing. Coherent Control. Measurement. Decoherence. Microscopic and macroscopic quantum systems. Trapped Ions, Rydberg Atoms, Photons, Quantum Dots, NV centers, Superconducting Circuits. During the past 20 years quantum physics has entered the domain of information technology in increasingly profound ways. Rapid progress in the physical sciences and in engineering and technology has allowed us to build information processing devices, which utilize the laws of quantum physics. In these processors information is stored in quantum states rather than classical states. As such the the superposition principle and entanglement can be exploited as new resources for processing, storing and protecting information. Information processors using quantum physics are expected to become potentially more powerful than their classical counterparts. Developments in this research field are driven by academic labs, startups and major industrial cooperations. The goal of this course is to provide a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics. Introduction to experimental systems for quantum information processing (QIP). - Quantum bits - Coherent Control - Measurement - Decoherence - DiVincenzo criteria QIP with - Ions - Superconducting Circuits - Photons - NMR - Rydberg atoms - NV-centers

		- Quantum dots

5	Contents	Das Modul hat zum Ziel, die Studierenden mit dem prinzipiellen Aufbau eines Mustererkennungssystems vertraut zu machen. Es werden die einzelnen Schritte von der Aufnahme der Daten bis hin zur Klassifikation von Mustern erläutert. Das Modul beginnt dabei mit einer kurzen Einführung, bei der auch die verwendete Nomenklatur eingeführt wird. Die Analog-Digital-Wandlung wird vorgestellt, wobei der Schwerpunkt auf deren Auswirkungen auf die weitere Signalanalyse liegt. Im Anschluss werden gebräuchliche Methoden der Vorverarbeitung beschrieben. Ein wesentlicher Bestandteil eines Mustererkennungssystems ist die Merkmalsextraktion. Verschiedene Ansätze zur Merkmalsberechnung/-transformation werden gezeigt, darunter Momente, Hauptkomponentenanalyse und Lineare Diskriminanzanalyse. Darüber hinaus werden Möglichkeiten vorgestellt, Merkmalsrepräsentationen direkt aus den Daten zu lernen. Das Modul schließt mit einer Einführung in die maschinelle Klassifikation. In diesem Kontext wird der Bayes- und der Gauss-Klassifikator besprochen. The module aims to familiarize students with the basic structure of a pattern recognition system. The individual steps from the acquisition of data to the classification of patterns are explained. The module starts with a short introduction, which also introduces the used nomenclature. Analog-to-digital conversion is introduced, with emphasis on its impact on further signal analysis. Common methods of preprocessing are then described. An essential component of a pattern recognition system is feature extraction. Various approaches to feature computation/ transformation are demonstrated, including moments, principal component analysis, and linear discriminant analysis. In addition, ways to learn feature representations directly from the data are presented. The module concludes with an introduction to machine classification. In this context, the Bayes and Gauss classifiers are discussed. T
6	Learning objectives and skills	Die Studierenden • erklären die Stufen eines allgemeinen Mustererkennungssystems • verstehen Abtastung, das Abtasttheorem und Quantisierung • verstehen und implementieren Histogrammequalisierung und -dehnung • vergleichen verschiedene Schwellwertmethoden • verstehen lineare, verschiebungsinvariante Filter und Faltung

		• wenden verschiedene Tief- und Hochpassfilter sowie nichtlineare Filter an • wenden verschiedene Normierungsmethoden an • verstehen den Fluch der Dimensionalität • erklären verschiedene heuristische Merkmalsberechnungsmethoden, z.B. Projektion auf einen orthogonalen Basisraum, geometrische Momente, Merkmale basierend auf Filterung • verstehen analytische Merkmalsberechnungsmethoden, z.B. Hauptkomponentenanalyse, Lineare Diskriminanzanalyse • verstehen die Basis von Repräsentationslernen • erläutern die Grundlagen der statistischen Klassifikation (Bayes-Klassifikator) • benutzen die Programmiersprache Python, um die vorgestellten Verfahren der Mustererkennung anzuwenden • lernen praktische Anwendungen kennen und wenden die vorgestellten Algorithmen auf konkrete Probleme an The students • explain the stages of a general pattern recognition system • understand sampling, the sampling theorem, and quantization • understand and implement histogram equalization and expansion • compare different thresholding methods • understand linear, shift invariant filters and convolution • apply various low-pass, high-pass, and nonlinear filters • apply different normalization methods • understand the curse of dimensionality • explain different heuristic feature calculation methods, e.g. projection on an orthogonal base space, geometric moments, features based on filtering • understand analytical feature computation methods, e.g. principal component analysis, linear discriminant analysis • understand the basis of representation learning • explain the basics of statistical classification (Bayes classifier) • use the programming language Python to apply the presented pattern recognition methods • learn practical applications and apply the presented algorithms to concrete problems
7	Prerequisites	Ein Mustererkennungssystem besteht aus den folgenden Stufen: Aufnahme von Sensordaten, Vorverarbeitung, Merkmalsextraktion und maschinelle Klassifikation. Dieses Modul beschäftigt sich in erster Linie mit den ersten drei Stufen und schafft damit die Grundlage für weiterführende Module (Pattern Recognition und Pattern Analysis). A pattern recognition system consists of the following stages: Sensor Data Acquisition, Preprocessing, Feature Extraction, and Machine Classification. This module primarily deals with the first three stages and

		thus creates the basis for more advanced modules (Pattern Recognition and Pattern Analysis).

5	Contents	The lectures provide an overview of the most important methods for the statistical evaluation of measured data. It lays the foundation for bachelor and master theses in experimental physics. In the first part of the lectures we will deal with the basics of statistics and probability theory. The second part of the lectures provides an introduction to measurement error and error calculation, parameter estimates and confidence intervals. For some of the exercises we will use computer (python language), which will be useful for the data analysis in the context of a Bachelor / Master thesis. The topics will include: Part I. Probability and statistics • Introduction to statistics and probability theory • Special distributions: Gaussian, Poisson, Multinomial • Parameter estimators of the distribution (mean, variance, bias etc.) • Multi-dimensional distributions • Random sampling Part II. Statistical interpretation of measurements • Least squared method • Chi2 fitting • Maximal likelihood • Bayesian statistics • Estimation of confidence intervals • Binned and unbinned analysis
6	Learning objectives and skills	Students • understand the basic concepts of probability and statistics • gain an understanding of the relevance of statistics for experimental data • learn how to statistically interpret data • understand how to choose the relevant statistical method
7	Prerequisites	To successfully follow this lecture basic knowledge of Python is advantageous. Alternatively, participants should be willing to learn how to program alongside this class. It is recommended to first complete "Datenverarbeitung in der Physik (DV)".
8	Integration in curriculum	semester: 1
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222 May be applied to specialisation 'Astrophysics and astroparticle physics' in the physics master program.

5	Contents	This is a course introducing modern techniques of machine learning, especially deep neural networks, to an audience of physicists. Neural networks can be trained to perform diverse challenging tasks, including image recognition and natural language processing, just by training them on many examples. Neural networks have recently achieved spectacular successes, with their performance often surpassing humans. They are now also being considered more and more for applications in physics, ranging from predictions of material properties to analyzing phase transitions. We will cover the basics of neural networks, convolutional networks, autoencoders, restricted Boltzmann machines, and recurrent neural networks, as well as the recently emerging applications in physics. Prerequisites: almost none, except for matrix multiplication and the chain rule.
6	Learning objectives and skills	• explain the relevant topics of the lecture • apply methods to specific examples
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222 May be applied to specialisation 'Astrophysics and astroparticle physics' in the physics master program.
10	Method of examination	Written examination (120 minutes)
11	Grading procedure	Written examination (100%)
12	Module frequency	Irregular
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)

4	Module coordinator	Prof. Dr.-Ing. Andreas Maier
5	Contents	Deep Learning (DL) has attracted much interest in a wide range of applications such as image recognition, speech recognition and artificial intelligence, both from academia and industry. This lecture introduces the core elements of neural networks and deep learning, it comprises: • (multilayer) perceptron, backpropagation, fully connected neural networks • loss functions and optimization strategies • convolutional neural networks (CNNs) • activation functions • regularization strategies • common practices for training and evaluating neural networks • visualization of networks and results • common architectures, such as LeNet, Alexnet, VGG, GoogleNet • recurrent neural networks (RNN, TBPTT, LSTM, GRU) • deep reinforcement learning • unsupervised learning (autoencoder, RBM, DBM, VAE) • generative adversarial networks (GANs) • weakly supervised learning • applications of deep learning (segmentation, object detection, speech recognition, ...) The accompanying exercises will provide a deeper understanding of the workings and architecture of neural networks.
6	Learning objectives and skills	The students • explain the different neural network components, • compare and analyze methods for optimization and regularization of neural networks, • compare and analyze different CNN architectures, • explain deep learning techniques for unsupervised / semi-supervised and weakly supervised learning, • explain deep reinforcement learning, • explain different deep learning applications, • implement the presented methods in Python, • autonomously design deep learning techniques and prototypically implement them, • effectively investigate raw data, intermediate results and results of Deep Learning techniques on a computer,

		• autonomously supplement the mathematical foundations of the presented methods by self-guided study of the literature, • discuss the social impact of applications of deep learning applications.
7	Prerequisites	None

5	Contents	Course Advanced Experimental Physics: Lasers, Atomic Physics and Quantum Optics (EV-A) • Introduction: Fundamental Properties and working scheme of the Laser, applications • Optical resonators: Ray transfer matrix analysis, stability criteria for optical resonators • Propagation of waves in optical media: Solutions to the wave equation, complex index of refraction, dispersion • Gaussian beams: Solution of the paraxial wave equation, Gaussian beams of higher order, properties of Gaussian beams, Gaussian beams and resonators, resonators as interferometer and spectrometer • Light-matter interaction: Classical description, semiclassical description, stimulated emission, black body radiation, interaction of a two-level atom with a monochromatic wave • Theory of the laser: Maxwell-Bloch-equations, laser operation in equilibrium, rate equations, outcoupled laser power, relaxation oscillations, micro-lasers, laser noise (Schawlow-Townes-Limit), generation and measurement of ultrashort pulses • Laser systems: Gas lasers, solid state lasers, vibronic lasers, laser frequency analysis and stabilization • Laser spectroscopy: Spectral lines + -profiles, broadening mechanisms, doppler-free spectroscopy • Cooling and trapping of atoms: Doppler cooling, magneto-optical trap, trapping of single atoms, Bose-Einstein-condensation • Introduction to non-linear optics: Introduction to quantum optics, Hanbury-Brown-Twiss experiment, quantum nature of light, photon correlations, photon statistics, examples of	

non-classical light, bunching und antibunching of photons, resonance fluorescence

Course Advanced Experimental Physics: Particle and Astroparticle Physics (EV-B)

- Introduction: Interactions and exchange bosons, Feynman diagrams; relativistic kinematics with four- vectors
- Covariant description of spin-less particles: Free particles, spatial probability density, charge current density, equation of continuity; Klein-Gordon equation: Solutions for free particles, energy eigenvalues, interpretation by Feynman and Stückelberg; scattering on a static potential: Perturbative approach, transition matrix element, Fermi's Golden Rule
- Electrodynamics of spin-1/2 particles: Maxwell equations in covariant notation; Dirac equation (free particles, gamma matrices, spin, anti-particles, helicity, charge current density, equation of continuity); electron- muon scattering: Current-current interaction, photon propagator, Feynman rules, helicity conservation, spin averaging (without explicit calculation), differential cross section; electron-positron annihilation to muons or quarks, hadron/muon ratio R; decay width and its relation to matrix element and phase space factor; higher orders: Anomalous magnetic moment ($g-2$), charge renormalisation, running coupling constant
- Weak interactions: Charged current: (V-A) structure and parity violation, propagator, Fermi constant, quark mixing: Cabibbo angle, CKM matrix, its complex phase and CP violation, direct and indirect CP violation; massive neutrinos; Oscillations, PMNS matrix, oscillation phenomenology of solar, atmospheric and reactor neutrinos
- Neutral currents and electroweak unification: Weak isospin and hypercharge, $SU(2) \times U(1)$; electroweak coupling: Weinberg angle, Z- fermion-couplings
- Gauge theories and Higgs mechanism: Euler-Lagrange equation, global gauge invariance and current conservation: local gauge invariance and QED: Mass and interaction terms, photon field, spontaneous $U(1)$ symmetry breaking; Higgs mechanism for $U(1)$: Gauge freedom, Higgs mass and interaction terms, masses of $U(1) \times SU(2)$ gauge bosons (without explicit derivation); Higgs coupling to Standard Model particles, Higgs production and decay

Course Advanced Experimental Physics: Solid State Physics (EV-C)

- Crystal structures
- Structure determination
- Vibrational properties
- Electronic structure
- Electronic transport
- Dielectric and optical properties

		• Magnetism • Superconductivity
6	Learning objectives and skills	Course Advanced Experimental Physics: Lasers, Atomic Physics and Quantum Optics (EV-A) Students • explain and analyze advanced topics of lasers, atomic physics and quantum optics as outlined in the table of contents • apply the associated physical concepts to specific problems using appropriate methods Course Advanced Experimental Physics: Particle and Astroparticle Physics (EV-B) Students • explain and analyze advanced experimental topics of particle and astroparticle physics as outlined in the table of contents • apply the associated physical concepts to specific problems using appropriate methods Course Advanced Experimental Physics: Solid State Physics (EV-C) • explain and analyze advanced experimental topics of solid state physics as outlined in the table of contents • apply the associated physical concepts to specific problems using appropriate methods

5	Contents	Course Advanced Quantum Mechanics (TV-A): The course covers an introduction to quantum field theory. The following main topics will be discussed in the lecture: • Motivation Quantum Field Theory • Classical Field Theory (Hamiltonian, Lagrange formalism for classical field theories) • Relativistic Quantum Mechanics (Klein-Gordon and Dirac equation) • Representation Theory Lorentz- und Poincare-Groups (finite dimensional scalar-, vector, tensor and spinor representations of the Lorentz group, infinite dimensional representations: field representations, finite and infinite dimensional representation of the Poincare group) • Quantisation of Free Fields (multi particle states, Fock space, canonical quantisation of scalar, vector and spinor fields) • Quantisation of Interacting Field Theories (interaction picture, Dyson series, perturbation theory, S-matrix, Feynman rules, Higgs Mechanism) Course Advanced Solid State Physics (TV-B): The following main topics will be discussed in this course: • Structure of solids: Bravais lattices, reciprocal lattice, Brillouin zone • The solid as a many-body problem: Hamiltonian of a solid, electron-electron interaction, electron-ion interaction, separation of electronic and ionic motion (Born-Oppenheimer approximation), types of bonding • Lattice dynamics: Phonons: Harmonic approximation, classical solution, dispersion relation, acoustic and optical modes, Debye and Einstein model, quantum theory of lattice vibrations, phonons, density of states, van Hove singularities, thermal properties, anharmonic effects • Electrons in a periodic potential: Bloch theorem, band structure, nearly free electrons, tight-binding method, Wannier functions, metals, insulators, semiconductors, density of

		states, Fermi surface, quantum statistics, thermal properties, Fermi distribution • Electron-electron interaction: Hartree-Fock method, density functional theory, homogeneous electron gas • Topics of current research
6	Learning objectives and skills	Course Advanced Quantum Mechanics (TV-A): Students • comprehend, outline and explain classical and quantum field theory, as well as relativistic quantum mechanics • apply the methods of advanced quantum mechanics to specific problems Course Advanced Solid State Physics (TV-B): Students • comprehend, outline and explain the theory of structure and many-body properties of solids, phonons, electrons in a periodic potential and their interaction as well as transport theory • apply the methods of advanced theoretical solid-state physics to specific problems
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222
10	Method of examination	Written examination (120 minutes) Course Advanced Solid State Physics (TV-B): There will be weekly problem sheets for homework. Each week, the solution of the first problem on the respective problem sheet can be submitted voluntarily in writing for correction. Students who receive at least 50% of the points for their solutions will receive a grade bonus of 0.3 or 0.4 on their exam grade. A second grade bonus of 0.3 or 0.4 can be achieved independently from the first bonus by presenting solutions for at least three problems from different problem sheets during the exercise groups.
11	Grading procedure	Written examination (100%)
12	Module frequency	Every semester
13	Workload in clock hours	Contact hours: 105 h Independent study: 195 h
14	Module duration	1 semester

5	Contents	Data Scientists need a comprehensive toolbox for their work. This consists for example of data acquisition, data cleaning, data processing and data visualization. In this course, we highlight good practices and approaches, and provide intensive hands-on experience. In particular, this course covers: - Data handling and storage - Lossy and lossless data compression - Data acquisition and API usage - Data visualization in scientific figures and movies - Data analysis platforms - Multithreading and multiprocessing - Code vectorization and just-in-time compilation - Code profiling - Prototyping Graphical User Interfaces - Workflow optimization techniques
6	Learning objectives and skills	Students - will be able to create own code for working with data - can carry out research projects in data science - can apply code optimization strategies - can design own graphical user interfaces for convenient interaction with data - can produce high-quality data visualization as needed for scientific publications
7	Prerequisites	It is recommended to have prior knowledge of the programming language Python (e.g. through GSProg or SciProgPy) and first exposure to data.
8	Integration in curriculum	semester: 1
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222
10	Method of examination	Variable (60 minutes) Compulsory: Written Exam, 60 min Optional: Homework (12-14 units)
11	Grading procedure	Variable (100%) The grade consists of the exam grade to 100%. We grant bonus points according to passed homework units (up to a grade advantage of 0.7, if the exam was passed with at least grade 4.0).
12	Module frequency	Only in winter semester

4	Module coordinator	apl. Prof. Dr. Harald Köstler
5	Contents	The content of the lecture will consist of various topics of advanced C++ programming, aimed at teaching the proper and efficient usage of C++ for professional software development. These are basic language concepts, the C++11/C++14/C++17 standards, object oriented programming in C++, static and dynamic polymorphism, template metaprogramming, and C++ idioms and design patterns.
6	Learning objectives and skills	Wissen: Lernende können die grundlegenden Sprachkonstrukte in den verschiedenen C++ Standards wiedergeben. Students know the basic language constructs from different C++ standards. Verstehen: Lernende verstehen das C++ Objektmodell und können es mit anderen Programmiersprachen vergleichen. Students understand the C++ object model and are able to compare it to other programming languages. Anwenden: Lernenden können Standardalgorithmen in einer objektorientierten Programmiersprache implementieren. Students can implement standard algorithms in an object oriented programming language. Analysieren: Lernende können gängige Design Patterns klassifizieren und deren Anwendbarkeit für bestimmte Probleme diskutieren. Students are able to classify common design patterns and to discuss their usability for certain problems. Evaluiere (Beurteilen): Lernende können entscheiden, welches Software Design passend für eine bestimmte Aufgabe ist. Sie können auch den Implementierungsaufwand dafür abschätzen. Students can decide, which software design fits for a certain task. They are also able to estimate the programming effort for it. Erschaffen: Lernende entwickeln selbständig in einer Gruppe ein größeres Softwarepaket im Bereich Simulation und Optimierung. Students develop together in a group a larger software project in the area of simulation and optimization on their own

		Fachkompetenz Anwenden Students are able to implement standard algorithms in an object oriented language.
7	Prerequisites	*Die Übung "Advanced Programming Techniques" im Umfang von 2,5 ECTS kann in den Wahlvertiefungsbereich B8 eingebracht werden.*
8	Integration in curriculum	semester: 5
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222 Zu diesem Modul gehört eine verpflichtende Übung im Wert von 2,5 ECTS, die in den Wahlvertiefungsbereich B8 eingebracht werden kann.

5	Contents	This lecture course will give an overview and sketch the basics of advanced modern methods of artificial intelligence and machine learning. It will describe how they are used in artificial scientific discovery, in physics and other fields. Artificial scientific discovery aims to automatize all aspects of the scientific process. We will discuss (and also implement, in the tutorials): • how to extract the essence of data (representation learning) • how to choose the best experiments to do (active learning / experimental design) • how to come up with scientific hypotheses automatically and how to rule them out • how to discover optimal strategies (reinforcement learning) • how to learn the statistics of observations and reproduce them (generative probabilistic modeling) The modern tools discussed will include transformers, diffusion models, and graph neural networks. In addition, we provide the basics of information science and statistics needed to understand these approaches.

5	Contents	All quantum systems must be regarded as open systems since they can never be perfectly isolated from their surroundings. In particular, the control of quantum experiments always involves external interventions such as the illumination by laser light. The interaction of quantum systems with their environment inherently leads to irreversible effects of dissipation and decoherence, which play a key role in state-of-the-art quantum experiments. On the other hand, maintaining quantum coherence for a long time is crucial for the development of quantum technologies, such as quantum computing. In this course, we will first derive the equation of motion – the quantum master equation – from the microscopic theory of open quantum systems. Then, we will discuss universal dynamical maps and the quantum jump approach. Finally, we will employ this formalism to discuss the loss of quantum superpositions and entanglement due to the coupling of quantum systems to their environment. During tutorials, you will use analytical methods to describe the evolution, steady states, and symmetries of open quantum systems. Additionally, you will learn how to numerically solve the quantum master equation using the Python library "QuTiP".
6	Learning objectives and skills	You will learn how quantum systems interact with their environment and how this interaction gives rise to phenomena like decoherence and dissipation. Furthermore, you will acquire analytical and numerical methods required to describe these effects in quantum experiments, including quantum optical systems, and quantum devices such as noisy intermediate-scale quantum computers.
7	Prerequisites	Knowledge of quantum mechanics including the concepts of quantum states, density matrices, unitary evolution, Schrödinger equation, and measurements.
8	Integration in curriculum	no Integration in curriculum available!

5	Contents	<i>MRI (Magnetic Resonance Imaging) stands out due to its unparalleled ability to capture high-resolution, detailed images of soft tissues, essential for diagnosis. As MRI technology rapidly evolves with advancements like AI integration, motion correction, and novel scanning techniques (such as spiral imaging), it's crucial to understand these developments.</i> <i>In this seminar, we will be discussing these innovations, gaining insights into how MRI can become faster, more accessible, and even more precise, impacting patient outcomes and future clinical applications.</i> <i>The seminar will try to replicate a scientific conference presentation, allowing students to present a topic in the aforementioned (for 30 mins). Following, the presentation, lecturers and fellow attendees will ask questions to foster discussion. At the end submitting an IEEE format report (around 10 pages).</i> <i>The presentations will be conducted as a block seminar towards the end of the semester. The weekly hours mentioned in the module description are an optional time slot to get support, guidance and feedback on topic (as required).</i>
6	Learning objectives and skills	<i>By the end of this module, are able to:</i> -analyse and interpret scientific research papers. -learn about MRI's State-of-art. -deepen their knowledge of MRI.

		- present and introduce the current MRI trends to their student peers. -give a scientific talk in English.
7	Prerequisites	<i>This module is recommended for Master's students. It is highly recommended that students have completed the MRI-1 course.</i>
8	Integration in curriculum	semester: 1
9	Module compatibility	Related Fields Master of Science Advanced Optical Technologies 20222 M. Sc. Medizintechnik
