

Module description

for the degree programme

Master of Science Advanced

Signal Processing &

Communications Engineering

(Version of examination regulation: 20202)

for the summer term 2024

Table of contents

Game theory with applications to information engineering (48430).....	4
Information theory and coding (48410).....	6
Kick-Off Seminar, Winter and Summer School (48460).....	9
Machine learning in signal processing (48440).....	11
Master's thesis (1999).....	13
Mathematical optimization in communications and signal processing (48400).....	14
Research Project (Major) (48470).....	15
Selected Topics in ASC (48450).....	17
Statistical Signal Processing (48420).....	19
Technical Mandatory Electives	
Advanced communication networks (151664).....	23
Advanced topics in deep learning (42800).....	27
Channel coding on graphs (412023).....	28
Communciations systems design (700506).....	31
Convex optimization in communications and signal processing (96850).....	33
Embedded systems (44410).....	35
Human computer interaction (645618).....	37
Image and video compression (96310).....	40
Introduction to deep learning (43405).....	43
Introduction to modern cryptography (93015).....	46
MIMO communication systems (96300).....	47
Mobile communications (43141).....	49
Quality of service in communication systems (44362).....	51
Radar, RFID and wireless sensor systems (RWS) (96316).....	53
Research Project (Minor) (48480).....	55
Speech and audio signal processing (96460).....	57
Technical Lab Courses	
Audio processing laboratory (894349).....	61
Communications systems design (92355).....	63
Lab course image and video processing on embedded platforms (194239).....	65
Lab course machine learning in signal processing (878210).....	68
Laboratory course: Image and video signal processing on embedded platforms (97525).....	71
Laboratory course: Mobile communication (97640).....	74
Laboratory course: Numerical methods for semiconductor components (92504).....	77
Laboratory course: Statistical signal processing (97535).....	78
Laborpraktikum Digitale Signalverarbeitung (97520).....	80
Laborpraktikum Multimediakommunikation (97651).....	82
Technical Electives	
4G/5G mobile communications systems (96065).....	85
Advanced networking LEx (869547).....	87
Advanced optical communication systems (621649).....	89
Advanced topics in deep learning (42800).....	91
AI-enabled wireless networks (93172).....	92
Approximate computing (965820).....	95
Architectures for digital signal processing (96010).....	97
Audio processing for the Internet of Things (44522).....	99
Biomedical signal analysis (23070).....	101
Body area communications (816185).....	105
Business intelligence (57043).....	107

Channel coding (96270).....	108
Cognitive neuroscience for AI developers (44445).....	112
Communication networks (92290).....	114
Communications systems design (92355).....	116
Compressive sensing (48447).....	118
Computer vision (713618).....	121
Convex optimization in communications and signal processing (96850).....	123
Cryptocurrencies (566245).....	125
Diagnostic medical image processing (44150).....	126
Equalisation and adaptive systems for digital communications (43400).....	128
Image, video and multidimensional signal processing (96312).....	131
Interventional medical image processing (44140).....	134
Introduction to deep learning (43405).....	136
Linear and non-linear fibre optics (267499).....	139
Machine learning for time series (428256).....	141
Machine learning in communications (668129).....	143
Microwave technology (92720).....	144
Molecular communications (454183).....	146
Multiuuser information and communications theory (687141).....	148
Pattern analysis (44120).....	150
Pattern recognition (44130).....	153
Radar, RFID and wireless sensor systems (RWS) (96316).....	155
Radar signal processing (44400).....	157
Random matrices in communications and signal processing (451971).....	160
Reconfigurable computing (lecture with exercises) (741941).....	162
Reconfigurable computing (lecture with extended exercises) (714289).....	165
Reinforcement learning (93185).....	168
Self-organized networks (43960).....	170
Seminar: Wireless, radar and microwave techniques (92374).....	172
Signal analysis (250058).....	174
Speech and audio signal processing (96460).....	176
Speech enhancement (96880).....	179
Transforms in signal processing (498723).....	181
Transmission and detection for advanced mobile communications (43420).....	183
Virtual vision (96314).....	186

1	Module name 48430	Game Theory with Applications to Information Engineering Game theory with applications to information engineering	5 ECTS
2	Courses / lectures	Vorlesung: Game Theory with Applications to Information Engineering (2.0 SWS)	2,5 ECTS
3	Lecturers	Yuval Ofek-Shanny Prof. Dr. Veronika Grimm	

4	Module coordinator	
5	Contents	The course is an introduction to the fundamentals of game theory and mechanism design. Motivations are drawn from topics in information engineering and networked systems (e.g. incentive-compatible/dynamic resource allocation in networks, distributed control of wireline and wireless communication networks, multi-agent systems, pricing and investment decisions in the Internet). Also social and economic contexts will be covered in order to put the engineering applications into a broader perspective. The course emphasizes theoretical foundations of game theory and develops knowledge on the standard equilibrium notions in different environments.
6	Learning objectives and skills	Students acquire a more formal understanding of game theoretical concepts and learn to differentiate between different types of games and their appropriate solution concepts, including Strategic Form Games, Dynamic Games with Complete Information, Static Games with Incomplete Information, and Dynamic Games with Incomplete Information. They learn the applications of these concepts to real-world multi-person decision problems and to give predictions based on the equilibrium concepts studied in the course.
7	Prerequisites	Basic knowledge of game theory and its core applications
8	Integration in curriculum	semester: 2
9	Module compatibility	Pflichtmodul Master of Science Advanced Signal Processing & Communications Engineering 20202
10	Method of examination	Klausur (90 Minuten) The exam covers all materials from the lectures and exercise classes.
11	Grading procedure	Klausur (100%)
12	Module frequency	only in summer semester
13	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)
14	Module duration	1 semester
15	Teaching and examination language	german
16	Bibliography	Main:

Fudenberg, D. and Tirole, J. (2007), Game Theory, Cambridge, MIT Press.

Further:

Osborne, M. and Rubenstein, A. (1994), A Course in Game Theory, Cambridge, MIT Press.

1	Module name 48410	Information Theory and Coding Information theory and coding	5 ECTS
2	Courses / lectures	Übung: Informationstheorie und Codierung - Übungen (1.0 SWS) Vorlesung: Informationstheorie und Codierung (3.0 SWS)	- 5 ECTS
3	Lecturers	Kenneth Mayer Prof. Dr.-Ing. Ralf Müller	

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller
5	Contents	<p>1. Introduction: binomial distribution, (7,4)-Hamming code, parity-check matrix, generator matrix</p> <p>2. Probability, entropy, and inference: entropy, conditional probability, Bayes law, likelihood, Jensens inequality</p> <p>3. Inference: inverse probability, statistical inference</p> <p>4. The source coding theorem: information content, typical sequences, Chebychev inequality, law of large numbers</p> <p>5. Symbol codes: unique decidability, expected codeword length, prefix-free codes, Kraft inequality, Huffman coding</p> <p>6. Stream codes: arithmetic coding, Lempel-Ziv coding, Burrows-Wheeler transform</p> <p>7. Dependent random variables: mutual information, data processing lemma</p> <p>8. Communication over a noisy channel: discrete memory-less channel, channel coding theorem, channel capacity</p> <p>9. The noisy-channel coding theorem: jointly-typical sequences, proof of the channel coding theorem, proof of converse, symmetric channels</p> <p>10. Error-correcting codes and real channels: AWGN channel, multivariate Gaussian pdf, capacity of AWGN channel</p> <p>11. Binary codes: minimum distance, perfect codes, why perfect codes are bad, why distance isnt everything</p> <p>12. Message passing: distributed counting, path counting, low-cost path, min-sum (=Viterbi) algorithm</p> <p>13. Exact marginalization in graphs: factor graphs, sum-product algorithm</p> <p>14. Low-density parity-check codes: density evolution, check node degree, regular vs. irregular codes, girth</p> <p>15. Lossy source coding: transform coding and JPEG compression</p> <p>--</p> <p>1. Einleitung: Binomialverteilung, (7,4)-Hamming-Code, Paritätsmatrix, Generatormatrix</p> <p>2. Wahrscheinlichkeit, Entropie und Inferenz: Entropie, bedingte Wahrscheinlichkeit, Bayessches Gesetz, Likelihood, Jensensche Ungleichung</p> <p>3. Inferenz: Inverse Wahrscheinlichkeit, statistische Inferenz</p> <p>4. Das Quellencodierungstheorem: Informationsgehalt, typische Folgen, Tschebyschevsche Ungleichung, Gesetz der großen Zahlen</p>

		<p>5. Symbolcodes: eindeutige Dekodierbarkeit, mittlere Codewortlänge, präfixfreie Codes, Kraftsche Ungleichung, Huffmancodierung</p> <p>6. Stromcodes: arithmetische Codierung, Lempel-Ziv-Codierung, Burrows-Wheeler-Transformation</p> <p>7. Abhängige Zufallsvariablen: Transinformation, Datenverarbeitungslemma</p> <p>8. Kommunikation over gestörte Kanäle: diskreter gedächtnisloser Kanal, Kanalcodierungstheorem, Kanalkapazität</p> <p>9. Das Kanalcodierungstheorem: verbundtypische Folgen, Beweis des Kanalcodierungstheorems, Beweis des Umkehrsatzes, symmetrische Kanaäle</p> <p>10. Fehlerkorrigierende Codes und reale Kanäle: AWGN-Kanal, mehrdimensionale Gaußsche WDF, Kapazität des AWGN-Kanals</p> <p>11. Binäre Codes: Minimaldistanz, perfekte Codes, Warum perfekte Codes schlecht sind, Warum Distanz nicht alles ist</p> <p>12. Nachrichtenaustausch: verteiltes Zählen, Pfadzählen, günstigster Pfad, Minimumsummenalgorithmus</p> <p>13. Exakte Marginalisierung in Graphen: Faktorgraph, Summenproduktalgorithmus</p> <p>14. LDPC-Codes: Dichteevolution, Knotenordnung, reguläre und irreguläre Codes, Graphumfang</p> <p>15. Verlustbehaftete Quellencodierung: Transformationscodierung und JPEG-Kompression</p>
6	<p>Learning objectives and skills</p>	<p>The students apply Bayesian inference to problems in both communications and everyday's life.</p> <p>The students explain the concept of digital communications by means of source compression and forward-error correction coding.</p> <p>For the design of communication systems, they use the concepts of entropy and channel capacity.</p> <p>They calculate these quantities for memoryless sources and channels.</p> <p>The students proof both the source coding and the channel coding theorem.</p> <p>The students compare various methods of source coding with respect to compression rate and complexity.</p> <p>The students apply source compression methods to measure mutual information.</p> <p>The students factorize multivariate functions, represent them by graphs, and marginalize them with respect to various variables.</p> <p>The students explain the design of error-correcting codes and the role of minimum distance.</p> <p>They decode error-correcting codes by means of maximum-likelihood decoding and message passing.</p> <p>The students apply distributed algorithms to problems in both communications and everyday's life.</p> <p>The students improve the properties of low-density parity-check codes by widening the girth and/or irregularity in the degree distribution.</p> <p>The students transform source images into the frequency domain to improve lossy compression.</p> <p>--</p>

		<p>Die Studierenden wenden Bayessche Inferenz auf Probleme in der Nachrichtentechnik und im Alltagsleben an.</p> <p>Die Studierenden erklären die konzeptuelle Trennung von digitaler Übertragung in Quellen- und Kanalcodierung.</p> <p>Kommunikationssysteme entwerfen sie unter Betrachtung von Entropie und Kanalkapazität.</p> <p>Sie berechnen diese Größen für gedächtnislose Quellen und Kanäle.</p> <p>Die Studierenden beweisen sowohl das Quellen- als auch das Kanalcodierungstheorem.</p> <p>Die Studierenden vergleichen verschiedenartige Quellencodierungsverfahren hinsichtlich Komplexität und Kompressionsrate.</p> <p>Die Studierenden verwenden Quellencodierverfahren zur Messung von Transinformation.</p> <p>Die Studierenden faktorisieren Funktionen mehrerer Veränderlicher, stellen diese als Graph dar und marginalisieren sie bezüglich mehrerer Veränderlicher.</p> <p>Die Studierenden erklären den Entwurf von Kanalcodes und den Einfluss der Minimaldistanz.</p> <p>Sie decodieren Kanalcodes gemäß maximaler Likelihood und Nachrichtenaustausch.</p> <p>Die Studierenden wenden verteilte Algorithmen auf Probleme der Nachrichtentechnik und des Alltagslebens an.</p> <p>Die Studierenden verbessern die Eigenschaften von LDPC-Codes durch Erhöhung des Umfangs und/oder durch irreguläre Knotenordnungsverteilungen.</p> <p>Die Studierenden transformieren Bildquellen zur Verbesserung verlustbehafteter Kompression in den Frequenzbereich.</p>
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Pflichtmodul Master of Science Advanced Signal Processing & Communications Engineering 20212
10	Method of examination	Klausur (90 Minuten)
11	Grading procedure	Klausur (100%)
12	Module frequency	every semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h

1	Module name 48460	Kick-Off Seminar, Winter and Summer School	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller	
5	Contents	<p>Kick-off seminar:</p> <p>The three-day kick-off seminar takes place immediately prior to the lecture period of the first semester. It is intended to enable students to get to know one another and teaching staff to engage in exchange, mentors in particular. The programme consists of courses imparting useful soft skills in the areas of self-management, time management, teamwork, presentation techniques and academic writing. Also included is cultural training in preparation for working in environments with an international character and time periods spent abroad.</p> <p>Winter School:</p> <p>ASC students will participate in a one-week winter school held at the end of the first semester, with lectures that focus on industrial and professional experience. While scientific knowledge is one thing, social ability is also important to one's career. The main focus of the winter school is people and project management.</p> <p>Summer School:</p> <p>ASC students are required to participate in a two-week summer school jointly operated by TUM, Uni Stuttgart and FAU. It takes place after the second semester at the "Ferienakademie" in Sarntal, in which students from the three universities and various disciplines gather to work on timely projects.</p> <p>Students work in small groups on dedicated scientific topics that change from year to year. During the summer school, students will give presentations, submit reports, discuss their results in depth with both fellow students and supervisors, and compile proceedings. Alternatively, students can also design software projects which they will implement in this two-week period. Aside from scientific projects, the summer school is accompanied by many social activities, including hiking and campfire talks with industry leaders. Throughout this two-week summer school, ASC students have practical hands-on experience while having fun with their peers.</p>	
6	Learning objectives and skills	<p>The kick-off seminar allows the new students to get in touch with each other and their future professors right before the start of the programme. The winter school offers training on soft-skills, such as project and people management, as well as business development.</p>	

		The summer school prepares them for research-based training by working on scientific projects in a team.
7	Prerequisites	None

4	Module coordinator	Jürgen Seiler
5	Contents	<p>This course is an introduction into machine learning and artificial intelligence. The special emphasis is on applications to modern signal processing problems. The course is focused on design principles of machine learning algorithms. The lectures start with a short introduction, where the nomenclature is defined. After this, probabilistic graphical models are introduced and the use of latent variables is discussed, concluding with a discussion of hidden Markov models and Markov fields. The second part of the course is about deep learning and covers the use of deep neural networks for machine learning tasks. In the last part of the lecture, the use of deep neural networks for speech processing tasks is introduced.</p> <p>The course is based on the materials and video footage from Dr. Roland Maas. He is an outstanding machine learning expert and a former member of the Chair of Multimedia Communications and Signal Processing.</p>
6	Learning objectives and skills	<p>After attending the lecture, students will be able to</p> <ul style="list-style-type: none"> • understand regression and classification problems • apply PDF estimation algorithms • understand Gaussian mixture models and expectation-maximization • apply principal component analysis and independent component analysis • assess different estimation algorithms • explain the application of machine learning to system identification • apply hidden Markov models • understand different artificial neural network architectures • explain deep learning principles • apply artificial neural networks • devise learning strategies for deep neural networks • assess the application of deep neural networks for speech processing tasks.

4	Module coordinator	Prof. Dr. Frauke Liers-Bergmann
5	Contents	Content: The focus of this module is on methods for modeling and solving optimization problems as they occur in the field communication and signal processing. Starting from practical applications, different classes of optimization problems are introduced that include linear, mixed-integer linear, continuous non-linear as well as mixed-integer non-linear optimization problems. Advantages and disadvantages of different modeling techniques will be outlined and different reformulations will be presented in order to achieve efficient solution approaches. Students will learn how to present optimization results properly as well as how to interpret and evaluate these results for practical applications in communications and signal processing.
6	Learning objectives and skills	The students a)have an overview over mathematical optimization in practice b)apply mathematical optimization modeling and solution techniques c)decide which solution approaches are suitable for which class of models d)know available software and how to use it
7	Prerequisites	None

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller	
5	Contents	<p>This module is intended to develop the skills needed for independent scientific practice, through in-depth work within a topic such as audio processing, video coding, wireless communications, molecular communication, system design and implementation, machine learning, game theory, information theory, communication networks, or embedded systems. (Note that the topics for the Research Project Major Module must be different from the topic for the Research Project Minor Module.) Students first agree on a topic with their mentor and then define particular project aspects with an advisor from the appropriate field. A project typically includes attending relevant lectures (especially from the elective module catalog), internships, seminars, working with scientific literature ("directed reading"), evaluating algorithms, and designing hardware implementations. Cooperation with international research partners, potentially leading to a stay abroad, is strongly encouraged. Students must complete a final report for this module, aiming towards a conference publication.</p> <p>The Research Project Major Module bridges the gap between theoretical foundations and technical implementations. Students pursue their individual interests by consulting with their mentor and choosing optional mandatory elective modules and technical elective modules, allowing an application-specific immersion. By more advanced lectures and one-on-one directed reading courses, students deepen their knowledge of communications and multimedia technology. This project gives an interdisciplinary character to the ASC study programme. The Research Project Major Module implements innovative learning and teaching practices a key element is continuous contact between students and faculty. In directed reading courses, a small group of students studies and exchanges views on current scientific literature, supported by faculty. Faculty members also introduce students to scientific practice early on through scientific projects. Summer/winter schools and soft skills courses complement the scientific coursework and provide key skills.</p>	
6	Learning objectives and skills	<p>Domain-Specific Knowledge: Students have a solid theoretical background in communications and multimedia technology. Students develop a deep understanding of digital techniques for information acquisition, processing, analysis and transmission. In this context, students compare and contrast various methods and techniques by analyzing and evaluating them. Furthermore, students apply theoretical knowledge by implementing and testing concrete applications of social relevance. The elements</p>	

		<p>above develop the skills needed to transfer knowledge from theory into practice.</p> <p>Learning and Methodological Skills: The students apply specific signal processing techniques. They are able to communicate their results in a scientifically appropriate manner. They are capable of writing scientific texts independently and in a limited amount of time. Students recognize connections and inter-relations within a topic and are able to associate them with specific problem formulations.</p> <p>Personal Skills: Students are conscious of the strengths they can contribute to a project and the weaknesses that they must address through specific measures. Students expand their understanding of a topic by implementing algorithms and procedures, and testing them within concrete application scenarios. Students discuss their findings and challenges with faculty. Students have a solid command of independent scientific practice.</p> <p>Interpersonal Skills: Students communicate and discuss ideas in an intercultural context, in the style that is prevalent for scientific conferences and workshops. They can present and explain complex ideas in an easily comprehensible manner.</p>

4	Module coordinator	Prof. Dr.-Ing. Walter Kellermann	
5	Contents	<p>The course concentrates on fundamental methods of statistical signal processing and their applications. The main topics are:</p> <p>*Discrete-time stochastic processes in the time and frequency domain*</p> <p>Random variables (RVs), probability distributions and densities, expectations of random variables, transformation of RVs, vectors of normally distributed RVs, time-discrete random processes: probability distribution and densities, expectation, stationarity, cyclostationarity, ergodicity, correlation functions and correlation matrices, spectral representations, principal component analysis (PCA), Karhunen-Loève transform (KLT).</p> <p>*Estimation theory*</p> <p>estimation criteria, prediction, classical and Bayesian parameter estimation (including MMSE, Maximum Likelihood, and Maximum A Posteriori estimation), Cramer-Rao bound</p> <p>*Linear signal models*</p> <p>Parametric models (cepstral decomposition, Paley-Wiener theorem, spectral flatness), non-parametric models (all-pole, all-zero and pole-zero models, lattice structures, Yule-Walker equations, PARCOR coefficients, cepstral representation)</p> <p>*Signal estimation*</p> <p>Supervised estimation, problem classes, orthogonality principle, MMSE estimation, linear MMSE estimation for normally distributed random processes, optimum FIR filtering, optimum linear filtering for stationary processes, prediction and smoothing, Kalman filters, optimum multichannel filtering (Wiener filter, LCMV, MVDR, GSC)</p> <p>*Adaptive filtering*</p> <p>Gradient methods, LMS, NLMS, APA and RLS algorithms and their convergence behavior</p> <p>*Zeitdiskrete Zufallsprozesse im Zeit- und Frequenzbereich*</p> <p>Zufallsvariablen (ZVn), Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte; Transformation von ZVn; Vektoren normalverteilter ZVn; zeitdiskrete Zufallsprozesse (ZPe): Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte, Stationarität, Zyklstationarität, Ergodizität, Korrelationsfunktionen und -matrizen, Spektraldarstellungen; Principal Component Analysis, Karhunen-Loeve Transformation;</p> <p>*Schätztheorie*</p> <p>Schätzkriterien; Prädiktion; klassische und Bayessche Parameterschätzung (inkl. MMSE, Maximum Likelihood, Maximum A Posteriori); Cramer-Rao-Schranke</p> <p>*Lineare Signalmodelle*</p>	

		<p>Parametrische Modelle (Cepstrale Zerlegung, Paley-Wiener Theorem, Spektrale Glattheit); Nichtparametrische Modelle: Allpole-/Allzero-/ Pole-zero-(AR/MA/ARMA) Modelle; Lattice-Strukturen, Yule-Walker Gleichungen, PARCOR-Koeffizienten, Cepstraldarstellungen;</p> <p>*Signalschätzung* Überwachte Signalschätzung, Problemklassen; Orthogonalitätsprinzip, MMSE-Schätzung, lineare MMSE-Schätzung für Gaußprozesse; Optimale FIR-Filter; Lineare Optimalfilter für stationäre Prozesse; Prädiktion und Glättung; Kalman-Filter; optimale Multikanalfilterung (Wiener-Filter, LCMV, MVDR, GSC);</p> <p>*Adaptive Filterung* Gradientenverfahren; LMS-, NLMS-, APA- und RLS-Algorithmus und Ihr Konvergenzverhalten.</p>
6	Learning objectives and skills	<p>The students:</p> <ul style="list-style-type: none"> analyze the statistical properties of random variables, random vectors, and stochastic processes by probability density functions and expectations as well as correlation functions and matrices and their frequency-domain representations know the Gaussian distribution and its role to describe the properties of random variables, vectors and processes understand the differences between classical and Bayesian estimation, derive and analyze MMSE and ML estimators for specific estimation problems, especially for signal estimation analyze and evaluate optimum linear MMSE estimators (single- and multichannel Wiener filter and Kalman filter) for direct and inverse supervised estimation problems evaluate adaptive filters for the identification of optimum linear estimators. <p>Die Studierenden</p> <ul style="list-style-type: none"> analysieren die statistischen Eigenschaften von Zufallsvariablen, -vektoren und stochastischen Prozessen mittels Wahrscheinlichkeitsdichten und Erwartungswerten, bzw. Korrelationsfunktionen, Korrelationsmatrizen und deren Frequenzbereichsdarstellungen kennen die spezielle Rolle der Gaußverteilung und ihre Auswirkungen auf die Eigenschaften von Zufallsvariablen, -vektoren und Prozessen verstehen die Unterschiede klassischer und Bayesscher Schätzung, entwerfen und analysieren MMSE- und ML-Schätzer für spezielle Schätzprobleme, insbesondere zur Signalschätzung analysieren und evaluieren lineare MMSE-optimale Schätzer (ein- und vielkanalige Wiener-Filter und Kalman-Filter) für direkte und inverse überwachte Schätzprobleme; evaluieren adaptive Filter zur Identifikation optimaler linearer Signalschätzer

5	Contents	<p>Telecommunications have become ubiquitous in daily life and wireless networks play a fundamental role thanks to their capability to support mobility. In a wireless communication, the concept of link does not exist. Users radiate energy and communicate through the superposition of each others transmissions which creates interference. Compared to wireline networks this scenario is extremely challenging but also offers unpredictable opportunities in the development of new technologies (massive MIMO, cognitive radio, etc.) and exploitation of new features, e.g., opportunistic communications and multiuser diversity. The exponentially increasing request of higher and higher throughput is satisfied densifying users and access points per unit area and allowing more and more interference while adopting advanced techniques and innovative resource allocation to mitigate the detrimental effects of interference.</p> <p>Objective of this course is to introduce the student to advanced techniques for coordinated medium access control and radio resource management in cellular systems. Power allocation, rate adaptation and scheduling will be discussed both in centralized and distributed settings. Some mathematical methods play a fundamental role in resource allocation, namely, classical Perron-Frobenius theory for nonnegative matrices, convex and nonconvex constrained optimization, distributed optimization and game theory. The course introduces the student to such methods and exemplifies their application to various resource allocation problems. Additionally, the course addresses relevant aspects of resource allocation in wireless networks such as fairness and cross-layer design.</p> <p>*Technical Content*</p> <ul style="list-style-type: none"> • Properties and challenges of the wireless medium. • Basic concepts of communication networks: the layered architecture. • Evolution of wireless cellular network architectures: From Global System for Mobile to Advanced-Long Term Evolution. • Multiple Access Schemes: CSMA variants, TDMA, FDMA, CDMA, OFDMA, SC-FDMA, SDMA. • Uplink-downlink duality. • Opportunistic scheduling and multiuser diversity.

		<ul style="list-style-type: none"> • Advanced concepts: small cells and heterogeneous networks, relaying and cooperation, network coding, cognitive radio networks. • Basics of resource allocation: power allocation, rate adaptation, and scheduling. • Classical resource allocation techniques: Centralized and distributed power control based on the Perron-Frobenius theorem. • Fundamentals of convex constrained optimization and application to resource allocation. • Resource allocation and fairness. • Fundamentals of nonconvex optimization and relaxation techniques. • Applications of nonconvex optimization to resource allocation. • Fundamentals of distributed optimization and applications to resource allocation. • Fundamental concepts of game theory. • Resource contention via game theoretical methods.
6	Learning objectives and skills	<p>The student</p> <ul style="list-style-type: none"> • Describes and/or recognizes wireless channel models. • Criticizes the limits of a layered architecture in wireless systems. • Defends the use of cross-layer design in wireless network. • Appraises and compares the distribution of functionalities in network entities for different architectures. • Argue on the pros and contras of different multiple access schemes according to various criteria (e.g. spectral efficiency, power efficiency, robustness to interference). • Compares and contrasts micro-diversity and various macro-diversity schemes. • Computes the total rate of SDMA with various receivers. • Relates the multiple access in uplink to broadcasting in downlink and justifies the concept of uplink-downlink duality. • Uses uplink-downlink duality to design a precoder and allocate power. • Contrasts multiple access in uplink and broadcasting in downlink in terms of channel state acquisition both for TDD and FDD transmission. • Uses multiuser diversity for opportunistic scheduling. • Compares multiuser diversity for users having identical and different channel statistics. • Contrasts opportunistic scheduling in terms of channel state acquisition and feedback both for uplink and downlink and for both FDD and TDD transmission schemes. • Appraises the impact of multiple antennas on opportunistic scheduling. • Analyses different settings with interference in small cells and designs countermeasures. • Categorizes relaying schemes in LTE.

		<ul style="list-style-type: none"> Analyses performance of relaying schemes. Argues on possible improvements of relaying schemes via network coding and physical layer network coding. Uses the Perron-Frobenius theorem to allocate power in a centralized manner. Judges the feasibility of a power control problems and formulates alternative approaches in case of unfeasibility. Uses the Perron-Frobenius theorem to design a distributed power control scheme. Judges the convergences of distributed power control based on the Perron-Frobenius theorem and appraises the robustness of asynchronous power control. Applies techniques of convex optimization to discriminate convex problems and determine necessary and/or sufficient conditions for global optimality. Judges the applicability of KKT conditions and duality. Uses KKT conditions to solve convex optimization problems. Uses duality to solve convex optimization problems. Applies convex optimization to resource allocation in wireless communications. Compares different definitions of fairness and applies them to rate allocation. Appraises the effect of channel knowledge at the transmitter on different fairness criteria. Applies KKT conditions for opportunistic user scheduling. Describes a proportional fair algorithm for opportunistic scheduling. Applies relaxation to nonconvex quadratic constrained quadratic programming. Formulates resource allocation problems as constrained optimization programming. Contrasts various distributed optimization methods. Applies the concept of best response to determine Nash equilibria. Argues about existence and uniqueness of Nash equilibria. Assesses if a given game is a potential game and solves it. Defends the concept of Pareto optimality in resource allocation. Contrasts the concepts of pure and mixed strategies in game theory. Uses coupled constrained concave game to allocate powers in heterogeneous networks.

5	Contents	<p>*Description*</p> <p>In today's communications world, channel coding underlies the physical layer of all major communication systems. For example: algebraic block coding (Reed-Solomon codes) are used in the CD and DVD standards; trellis coded modulation is used in line modems; low-density parity check codes (LDPC) are used in satellite communications (DVB-S2 standard), LAN (10GBase-T Ethernet) and wireless LAN (Wi-Fi 802.11); turbo codes are implemented in 3G/4G mobile communications (e.g. in UMTS and LTE) and in (deep space) satellite communications. Recently, polar codes have been adopted for the eMBB (Enhanced Mobile Broadband) control channels for the 5G NR (5th Generation New Radio) interface.</p> <p>Objective of this course is to provide an introductory but thorough background on codes over graphs and covers both classical convolutional codes and the modern theory of random-like codes with iterative decoding. Namely, LDPCs (Low Density Parity Check Codes, Turbo Codes, and Polar Codes). Students will acquire the fundamental knowledge to design and analyze performance of channel codes on graphs, as well as implement the corresponding encoders and decoders.</p> <p>*Technical Content*</p> <ul style="list-style-type: none"> • Role of channel coding in a communication system. • Idealized channel models : the binary symmetric channel (BSC), the binary erasure channel (BEC), the constrained-input Gaussian channel. • Some preliminary basic concepts from linear block codes: Parity Check, Hamming distance, weight enumerating functions, performance evaluations, and performance bounds. • Factor graphs and belief propagation. • Binary random-like codes: LDPC codes and message-passing decoding, threshold behaviour of message passing decoding: density evolution analysis. Design of LDPC ensembles. • Polar Codes: Polarization, polar channel coding, performance, encoding and decoding. • Binary convolutional codes : the algebraic structure, the dynamic structure, Viterbi decoding, performance analysis via weight enumerating function, the forward-backward algorithm. • Other random-like codes: the Turbo Codes. Efficient decoding of Turbo Codes via forward-backward algorithm and

		interpretation via factor graphs. Performance analysis and exit charts.

5	Contents	Convex optimization problems are a special class of mathematical problems which arise in a variety of practical applications. In this course we focus on the theory of convex optimization, corresponding algorithms, and applications in communications and signal processing (e.g. statistical estimation, allocation of resources in communications networks, and filter design). Special attention is paid to recognizing and formulating convex optimization problems and their efficient solution. The course is based on the textbook "Convex Optimization" by Boyd and Vandenberghe and includes a tutorial in which many examples and exercises are discussed.
6	Learning objectives and skills	Students <ul style="list-style-type: none"> • characterize convex sets and functions, • recognize, describe and classify convex optimization problems, • determine the solution of convex optimization problems via the dual function and the KKT conditions, • apply numerical algorithms in order to solve convex optimization problems, • apply methods of convex optimization to different problems in communications and signal processing

5	Contents	<p>Bei der digitalen Übertragung spielen Kanalverzerrungen aufgrund ständig steigender Datenraten eine immer grössere Rolle. Bei vielen Anwendungen müssen für eine zuverlässige Übertragung komplexe Entzerrverfahren eingesetzt werden. Dies gilt sowohl für die leitungsgebundene als auch die drahtlose Kommunikation. Z.B. werden in der xDSL-Systemfamilie (Digital Subscriber Lines), die eine schnelle digitale Übertragung über Ortsanschlussleitungen gewährleistet, oft entscheidungsrückgekoppelte Entzerrverfahren oder Vorcodierungsverfahren eingesetzt und beim Mobilfunkstandard GSM und seiner Weiterentwicklung EDGE (Enhanced Data Rates for GSM Evolution) Maximum-Likelihood-Sequenzschätzung bzw. zustandsreduzierte Entzerrung. Eng im Zusammenhang mit der eigentlichen Entzerrung stehen Adaptionverfahren, mit denen die Parameter des Entzerrers optimal an den Übertragungskanal angepasst werden können.</p> <p>Lernziel: Ziel der Vorlesung ist eine umfassende Darstellung gebräuchlicher Entzerrungs- und Adaptionverfahren. Den Teilnehmern sollen fundierte Kenntnisse der verschiedenen Verfahren vermittelt werden, die sie zu deren sinnvollem Einsatz in der Praxis befähigen.</p> <p>Content: Channel distortions are playing an increasingly important role in digital transmission due to constantly increasing data rates. In many applications, complex equalization techniques must be used for a reliable transmission. This applies to both wired and wireless communication. For example, decision feedback equalization or precoding techniques are often used in the xDSL (Digital Subscriber Lines) system family, which ensures fast digital transmission over local subscriber loops, and the GSM system and its advanced version EDGE (Enhanced Data Rates for GSM Evolution) employ maximum likelihood sequence estimation and state-reduced equalization. Closely related to the task of equalization are adaptation methods with which the parameters of the equalizer can be optimally adjusted to the transmission channel.</p> <p>Objective: The aim of the lecture is a comprehensive presentation of common equalization and adaptation methods. The participants should acquire an in-depth knowledge of the various procedures which enables them to make meaningful design decisions in practice.</p>
6	Learning objectives and skills	Die Studierenden

		<ul style="list-style-type: none"> • beschreiben verschiedene Verfahren zur Entzerrung frequenzselektiver Übertragungskanäle wie lineare Entzerrung, entscheidungsrückgekoppelte Entzerrung und Maximum-Likelihood-Sequenzschätzung, • setzen die verschiedenen Ansätze in Blockdiagramme um und optimieren deren Komponenten, • vergleichen Entzerrverfahren hinsichtlich ihrer Leistungsfähigkeit, charakterisiert durch die Fehlerrate, und Komplexität, • wählen geeignete Verfahren für verschiedene Anwendungen wie leitungsgebundene und drahtlose Übertragung aus, • entwerfen neuartige Verfahren für gegebene Anforderungen, • formulieren Adaptionalgorithmen zur automatischen Anpassung des Empfängers eines Übertragungssystems an den Kanal, • ordnen Entzerrverfahren einen geeigneten Adaptionalgorithmus zu. <p>Learning Objectives and Competences: The students</p> <ul style="list-style-type: none"> - describe various methods for equalizing frequency-selective transmission channels such as linear equalization, decision feedback equalization and maximum likelihood sequence estimation, - realize various approaches in block diagrams and optimize their components, - compare equalization methods in terms of their performance, characterized by the error rate, and complexity, - select suitable methods for various applications such as wired and wireless transmission, - design novel schemes for given requirements, - formulate adaptation algorithms for automatic adaptation of the receiver of a transmission system to the channel, - assign suitable adaptation algorithms to equalization schemes.
7	Prerequisites	Vorkenntnisse in Systemtheorie und digitaler Signalverarbeitung, sowie entweder der Vorlesung Nachrichtentechnische Systeme oder Digitale Übertragung sind für die Teilnahme hilfreich.

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller
5	Contents	History of mobile communications, cellular systems, sectorization, spectral efficiency, co-channel interference, adjacent-channel interference, near-far effect, cellular network architecture, antenna types and parameters, free space propagation, reflection, attenuation, diffraction, scattering, classification of channel models, ground reflection model, Okumura-Hata model, shadowing, narrow-band fading, time-variant channels, scattering function, delay-Doppler spectrum, diversity principles, combining methods, diversity gain, multiplexing, duplexing, digital modulation, Gaussian filtered minimum shift keying, basics of channel coding, interleaving, global system for mobile communications, physical versus logical channels, frame structure, call set-up, synchronization, channel estimation, hand-off
6	Learning objectives and skills	The students explain the cellular structure of mobile communication systems. They students explain the physical mechanics of radio wave propagation in the cm-band. The students explain the GSM cellular communications standard. The students discuss the pros and cons of several multiple-access and duplexing methods. The students discuss the pros and cons of several modulation and coding formats. The students decide which antenna type is suitable for a given morphological structure of the environment. The students predict the amplitude and dynamic of the attenuation between a mobile transmitter and a fixed receiver. The students utilize diversity methods to improve the link quality. The students determine the coverage probability of a given cellular communication system. The students collaborate on solving exercise problems. The students discuss which system solutions fit to which environments.

1	Module name 48480	Research Project (Minor)	10 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller	
5	Contents	<p>This module is intended to develop the skills needed for independent scientific practice, through in-depth work within a topic such as audio processing, video coding, wireless communications, molecular communication, system design and implementation, machine learning, game theory, information theory, communication networks, or embedded systems. (Note that the topics for the Minor Research Project Module must be different from the topic for the Major Research Project Module.) Students first agree on a topic with their mentor and then define particular project aspects with an advisor from the appropriate field. A project typically includes attending relevant lectures (especially from the elective module catalog), internships, seminars, working with scientific literature ("directed reading"), evaluating algorithms, and designing hardware implementations. Cooperation with international research partners, potentially leading to a stay abroad, is strongly encouraged. Students must complete a final report for this module, aiming towards a conference publication.</p> <p>The Minor Research Project Module bridges the gap between theoretical foundations and technical implementations. Students pursue their individual interests by consulting with their mentor and choosing optional mandatory elective modules and technical elective modules, allowing an application-specific immersion. By more advanced lectures and one-on-one directed reading courses, students deepen their knowledge of communications and multimedia technology. This project gives an interdisciplinary character to the ASC study programme. The Minor Research Project Module implements innovative learning and teaching practices a key element is continuous contact between students and faculty. In directed reading courses, a small group of students studies and exchanges views on current scientific literature, supported by faculty. Faculty members also introduce students to scientific practice early on through scientific projects. Summer/winter schools and soft skills courses complement the scientific coursework and provide key skills.</p>	
6	Learning objectives and skills	<p>Domain-Specific Knowledge</p> <p>Students have a solid theoretical background in communications and multimedia technology. Students develop a deep understanding of digital techniques for information acquisition, processing, analysis and transmission. In this context, students compare and contrast various methods and techniques by analyzing and evaluating them. Furthermore, students apply theoretical knowledge by implementing and testing concrete applications of social relevance. The elements</p>	

		<p>above develop the skills needed to transfer knowledge from theory into practice.</p> <p>Learning and Methodological Skills The students apply specific signal processing techniques. They are able to communicate their results in a scientifically appropriate manner. They are capable of writing scientific texts independently and in a limited amount of time. Students recognize connections and inter-relations within a topic and are able to associate them with specific problem formulations.</p> <p>Personal Skills Students are conscious of the strengths they can contribute to a project and the weaknesses that they must address through specific measures. Students expand their understanding of a topic by implementing algorithms and procedures, and testing them within concrete application scenarios. Students discuss their findings and challenges with faculty. Students have a solid command of independent scientific practice.</p> <p>Interpersonal Skills Students communicate and discuss ideas in an intercultural context, in the style that is prevalent for scientific conferences and workshops. They can present and explain complex ideas in an easily comprehensible manner.</p>

5	Contents	This lab course offers a general introduction to Python and possibly also to other languages (MATLAB, R, ...). In particular, functions, transforms, and algorithms that are important for analyzing and processing audio signals are covered. After a general part, the lab course will allow the participants to delve into a more specific application within audio and acoustic signal processing.	
6	Learning objectives and skills	The goal of this lab course is to acquire a deeper understanding of audio processing techniques by experimenting with, modifying and extending existing code. Furthermore, programming skills in Python and possibly also in other languages (MATLAB, R, ...) are acquired. The students understand and implement computer programs for specific experiments described in the script accompanying the lab. They test and evaluate their programs by conducting a series of experiments within the field of audio signal processing. They understand the requirements of practical realizations, synthesize a solution for a given problem, and apply advanced disciplinary knowledge and skills in signal processing. The students evaluate and interpret results by applying various visualization techniques and statistical methods. They collaborate with fellow students, discuss their solutions, give feedback to each other, and reflect upon the underlying theory as well as implementation issues.	
7	Prerequisites	This lab course requires a good understanding of basic principles in signal processing and some basic programming skills. Furthermore, it is beneficial to have some background in one of the more specific topics offered by the International Audio Laboratories Erlangen.

5	Contents	<p>This is an advanced level lab course in machine learning. Imagine a car driving on an autobahn in an automatic mode. Among other things, the car needs to steer itself to keep driving in it's own lane. To accomplish this,</p> <p>the central problem is to detect the road-lane markings. These are the white solid or dashed lines that are drawn on each side of the lane. The standard modern approach to solve this type of problems is to take a large dataset of labeled examples and train a deep neural network model to accomplish the task. This is how car and pedestrian detection algorithms are developed. The difficulty with the road-lane markings is that there is no labeled dataset of them and creating such dataset would cost millions of dollars.</p> <p>In this lab course we will solve this problem using transfer learning and mathematical modeling:</p> <ul style="list-style-type: none"> • Create cartoon-like artificial images of a road with known locations for the lane markings. • Train deep neural network on these artificial images with heavy data augmentations that mimic real-world images. • Create a dataset of unlabeled real-life videos by downloading and organizing examples from youtube. • Create a machine learning pipeline for working with these videos efficiently. • Apply the neural network that has been trained on artificial data to the real world videos. • Analyze the quality of results produced by the network. • Use mathematical modeling to correct the outputs of the network. • Retrain the network on the dataset composed of the corrected outputs. • Measure and analyze the quality of the results. <p>The software will be written in Python using JupyterLab development framework. Access to modern GPU server will be provided. The best students will have the opportunity to contribute to the creation of state-of-the-art lane detection system for self-driving cars during or after the course.</p>	
6	Learning objectives and skills	<p>Students are able to:</p> <ul style="list-style-type: none"> • Independently design machine learning pipelines to solve complex problems in artificial intelligence. • Choose appropriate algorithms for the problem at hand. 	

		<ul style="list-style-type: none"> • Use standard packages for machine learning in Python: numpy, cvxpy, scikit-learn, pywavelets, pytorch. • Debug and calibrate machine learning algorithms. Develop modification to the standard algorithms as appropriate to the problem at hand. • Explain the theoretical aspects of deep learning.
7	Prerequisites	Knowledge of Python programming language is required. Basic theoretical knowledge in machine learning is assumed: consider taking the Machine Learning in Signal Processing (MLSIP) course in the same semester.

5	Contents	<p>Mobile communication plays a significant role in our daily life. Over the last three decades the mobile applications have been tremendously enhanced from voice only over mobile broadband to applications for the mobile internet. Currently, the next generation of cellular systems, the so-called 5th Generation (5G) is developed and first commercial 5G networks are expected to be deployed around mid of 2019. 5G will play an outstanding role for the Internet of Things and will redefine a wide range of industries by enabling new use cases. This lecture will provide the technical foundation of 4G (LTE) and 5G mobile communication systems with a focus on the radio access network and the PHY & MAC layer concepts.</p>	
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • learn the technical history of mobile communications from 2nd (GSM), 3rd (UMTS), 4th (LTE) to the 5th (5G New Radio) Generation • understand the system and radio access network architecture of modern cellular communications systems and their enhancements towards 5G • compare the physical layer design of LTE and 5G New Radio • discuss how 5G networks are designed to address a wide range of diverse services and devices • analyze enhanced radio resource management concepts for use cases like cellular V2X (Vehicle-to-Everything) and NB-IoT (Narrowband Internet of Things) <p>Die Studierenden</p> <ul style="list-style-type: none"> • erfahren die technische Geschichte der Mobilkommunikation von der 2. (GSM), 3. (UMTS), 4. (LTE) bis zur 5. Generation (5G New Radio) • verstehen die System- und Funkzugangsnetzarchitektur moderner zellulärer Kommunikationssysteme und ihre Verbesserungen bei 5G • vergleichen das Design der physikalischen Übertragungsschicht von LTE und 5G New Radio • diskutieren, wie 5G-Netze für eine breite Palette unterschiedlicher Dienste und Geräte konzipiert sind • analysieren verbesserte Funkressourcenverwaltungskonzepte für Anwendungsfälle wie zellulare V2X (Vehicle-to-Everything)

5	Contents	<p>This course introduces machine learning algorithms such as supervised, unsupervised, reinforcement, deep, and federated learning and their application in the next generation wireless and mobile networks. Different ML use cases are explained which solve problems in different layers of the protocol stack from the physical layer to the application layer. The course includes the following topics:</p> <ol style="list-style-type: none"> 1.Introduction to machine learning algorithms 2.Python programming language and its ML tools 3.AI-enabled wireless and mobile networks <ol style="list-style-type: none"> 3.1Cellular networks and ML use cases <ol style="list-style-type: none"> 3.1.1History of 2G to 4G, 5G and 6G vision 3.1.2ML use cases in physical, MAC and higher layers 3.25G-V2X (cellular-V2X) and ML use cases <ol style="list-style-type: none"> 3.2.1Sidelink communication as the key enabler 3.2.25G-V2X features and use cases 3.2.3ML use cases in 5G-V2X 3.3Intelligent wireless networks <ol style="list-style-type: none"> 3.3.1Cognitive radio networks 3.3.2ML use case in wireless networks 4.Standardization activities on AI-enabled wireless networks <ol style="list-style-type: none"> 4.1.13GPP and 5GAA 4.1.2ETSI Zero touch networks <p>*Exercises:*</p> <p>Literature review on the application of machine learning in wireless networks</p> <p>The exercise of this course includes a literature review research project where students work individually on a relevant topic. The steps to accomplish the research project are as follows:</p> <ol style="list-style-type: none"> A.Select a topic relevant to the application of ML in wireless networks and register it by email B.Search for the relevant papers and make a list of papers C.Study the papers and prepare a summary D.Present the outcomes <p>Each student should present her/his research study in an intermediate and a final presentation. A summary paper should be written following the "survey papers guideline" using IEEE format.</p> <p>The grade of the research project will be considered as a "Bonus point" (up to 20%) for the final grade.</p>	

6	Learning objectives and skills	<p>The students will be able to gain the following competencies after the successful completion of the course:</p> <ul style="list-style-type: none"> • Have knowledge on machine learning algorithms, current and the next generation wireless and mobile networks and their use cases • To know how to develop machine learning algorithms in Python • Know the most important problems in wireless and mobile networks which can be solved by machine learning algorithms • Have an insight on the exiting work relevant to the topic of the course • Learn the procedure of a scientific research study and publication of the outcome
7	Prerequisites	<p>*Motivation:*</p> <p>Rapid growth in the number of connected wireless nodes such as mobile phones, low power IoT devices, connected vehicles, etc. will expand the scale of the next generation of wireless and mobile networks. Moreover, the foreseen use cases like connected autonomous vehicles, smart homes and cities, ultra-fast and reliable industrial wireless networks, etc. will require ultra-low latency and highly reliable communication. Existing and traditional algorithms are not feasible for the optimization and management of such networks to fulfill the requirements of the emerging use cases due to their high complexity, high dynamicity, and the massive amount of the generated data by connected devices. Recently, artificial intelligence (AI) is planned to be utilized as a new paradigm for the design, development and optimization of the next generation wireless and mobile networks. Machine learning (ML) as a subset of AI will be applied to develop intelligent wireless nodes and infrastructures to address the demands of future use cases.</p>

1	Module name 965820	Approximate Computing Approximate computing	5 ECTS
2	Courses / lectures	Übung: Exercises to Approximate Computing (0.0 SWS) Vorlesung: Approximate Computing (2.0 SWS)	- 5 ECTS
3	Lecturers	Khalil Esper Pierre-Louis Sixdenier Prof. Dr.-Ing. Jürgen Teich	

4	Module coordinator	Joachim Falk Prof. Dr. Oliver Keszöcze Prof. Dr.-Ing. Jürgen Teich	
5	Contents	<p>Approximate Computing denotes a quite young research area that exploits the fact and capability of many applications and systems to tolerate imprecision and/or inexactness of computed results. Prominent areas of applications and novel techniques of computing approximate rather than exact results have brought up new implementations either at hardware and/or software levels for important emergent workloads such as searching, mining, image processing, and data retrieval.</p> <p>Although hardware technology is improving at a fast pace, energy and power are becoming more and more important constraints apart from exactly computing results in an acceptable amount of time. The main goals of approximate computing techniques are therefore to exploit the possible trade-off between power/energy consumption, accuracy, performance, and/or cost, e.g., utilized hardware resources.</p> <p>The purpose of the course approximate computing is to instruct students about the main ideas and concepts of approximate computing. This includes analyzing the trade-off between energy consumption, accuracy, run-time and hardware costs, concrete approximating techniques (e.g. approximate hardware synthesis, approximating algorithms) as well as theoretical background (determining the computational error and its complexity).</p>	
6	Learning objectives and skills	<p>Fachkompetenz - Wissen</p> <ul style="list-style-type: none"> The students know the principles and benefits of Approximate Computing and when it is applicable. The students know multiple error metrics and their semantic meaning. <p>Fachkompetenz - Verstehen</p> <ul style="list-style-type: none"> The students understand the difference between the error metrics. The students understand the principle of function falsification. The students can apply the presented approximation techniques. <p>Fachkompetenz - Anwenden</p> <ul style="list-style-type: none"> The students are capable of choosing the appropriate approximation technique based on given requirements.

5	Contents	<p>Inhalt</p> <p>Im Rahmen der Vorlesung werden (a) die Grundlagen der Generation von wichtigen Biosignalen im menschlichen Körper, (b) die Messung von Biosignalen und (c) Methoden zur Analyse von Biosignalen erläutert und dargestellt.</p> <p>Behandelte Biosignale sind unter anderem Aktionspotential (AP), Elektrokardiogramm (EKG), Elektromyogramm (EMG), Elektroenzephalogramm (EEG), oder Mechanomyogramm (MMG). Bei der Messung liegt der Fokus beispielsweise auf der Messtechnik oder der korrekten Sensor- bzw. Elektrodenanbringung. Im größten Teil der Vorlesung, Analyse von Biosignalen, werden Konzepte zur Filterung für die Artefaktreduktion, der Wavelet Analyse, der Ereigniserkennung und der Wellenformanalyse behandelt. Zum Schluss wird einen Einblick in überwachte Verfahren der Mustererkennung gegeben.</p> <p>Für weitere Informationen, besuchen Sie bitte unseren zugehörigen StudOn Kurs.</p> <p>Content</p> <p>The lecture content explains and outlines (a) basics for the generation of important biosignals of the human body, (b) measurement of biosignals, and (c) methods for biosignals analysis.</p> <p>Considered biosignals are among others action potential (AP), electrocardiogram (ECG), electromyogram (EMG), electroencephalogram (EEG), or mechanomyogram (MMG). The focus during the measurement part is for example the measurement technology or the correct sensor and electrode placement. The main part of the lecture is the analysis part. In this part, concepts like filtering for artifact reduction, wavelet analysis, event detection or waveform analysis are covered. In the end, an insight into pattern recognition methods is obtained.</p> <p>For more information, please visit our associated StudOn course</p>
6	Learning objectives and skills	<p>Die Studierenden können nach erfolgreichem Abschluss des Kurses</p> <p>Fachkompetenz</p> <p>Wissen</p> <ul style="list-style-type: none"> • die Entstehung, Messung und Charakteristika der wichtigsten Biosignale des menschlichen Körpers wiedergeben <p>Verstehen</p>

- die wesentlichen Ursachen von Artefakten in Biosignalen erklären
- Zusammenhänge zwischen der Entstehung der Biosignale des menschlichen Körper und dem gemessenen Signal erklären
- Messmethoden der wichtigsten Biosignale erklären
- Filteroperationen zur Eliminierung von Artefakten erläutern
- bekannte Algorithmen der Verarbeitung bestimmter Biosignale erklären (z.B. Pan Tompkins für EKG)
- typische Komponenten und ihre Bedeutung in einer generischen Signalanalyse Kette erläutern
- die Struktur und Funktionsweise von Systemen zur maschinellen Klassifikation einfacher Muster darstellen

Anwenden

- Signalcharakteristiken im Zeit- und Frequenzbereich bestimmen
- Algorithmen der Biosignalverarbeitung anwenden und in Python implementieren
- Filteroperationen zur Eliminierung von Artefakten anwenden und in Python implementieren
- Methoden selbstständig auf interdisziplinäre Fragestellungen der Medizin und der Ingenieurwissenschaften anwenden
- das Ergebnis von typischen Filteroperationen abschätzen

Analysieren

- Filtercharakteristika von Schaltkreisen ableiten
- Algorithmen der Biosignalverarbeitung vergleichen
- Klassifikationsprobleme in Python lösen
- Typische Artefakte in Biosignalen erkennen und Lösungsstrategien vorschlagen

Evaluieren (Beurteilen)

- Biosignale mit medizinischen Normalwerten vergleichen und im medizinischen Kontext evaluieren
- Klassifikationsergebnisse beurteilen
- die Bedeutung der Biosignalverarbeitung für die Medizintechnik diskutieren
- Probleme in Gruppen kooperativ und verantwortlich lösen und in der Übungsgruppe bzw. im Forum diskutieren

After completion of the course, students are able to

Knowledge

- reproduce the generation, measurement, and characteristics of important biosignals of the human body

Understanding

- explain the causes of artifacts in biosignals
- explain relations between the generation of biosignals and the measured signal
- explain methods for the measurement of important biosignals
- explain filter operations for the reduction of artifacts

		<ul style="list-style-type: none"> • explain algorithms for the analysis of important biosignals (e.g. Pan Tompkins for EKG) • explain typical components and their importance in the signal analysis chain • explain the structure and functioning of systems for machine learning and pattern recognition <p>Application</p> <ul style="list-style-type: none"> • determine signal characteristics in the time and frequency domain • apply and implement algorithms for signal analysis in Python • implement filter operations for the reduction of artifacts in Python • estimate the result of filter operations • apply methods to interdisciplinary problems in medicine and medical engineering <p>Analyze</p> <ul style="list-style-type: none"> • derive filter characteristics from electric circuits • compare signal analysis algorithms • solve classification problems in Python • recognize typical artifacts in biosignals and propose solutions for their reduction <p>Evaluation</p> <ul style="list-style-type: none"> • compare biosignals with medical norm values and evaluate them in a medical context • evaluate classification results • discuss the importance of biomedical signal analysis for medical engineering • solve and discuss problems in groups cooperatively in the group exercises and the online forum
7	<p>Prerequisites</p>	<p>Prerequisites</p> <p>The Biosig lectures and exercises do not have formal requirements. However, we expect you to have some knowledge about the following topics:</p> <ul style="list-style-type: none"> • Basics of Physiology and Anatomy (High-school level) • <ul style="list-style-type: none"> ◦ Basic elements of electronic circuits (resistor, capacitor, inductor) and related equations • Basic math: Integration, Differentiation, Limits • <ul style="list-style-type: none"> ◦ Fourier Transform (qualitative understanding) ◦ Basic filter types ◦ z-plane (qualitative understanding) <p>Furthermore, some knowledge in the following topics will be beneficial to easily understand the content of the lecture:</p> <ul style="list-style-type: none"> • Advanced filter concepts • z-plane math / z-transform / pole-zero plots

		<ul style="list-style-type: none"> • Frequency domain math / detailed understanding of Fourier transform and its properties • Laplace transform • Basics of Python (for the exercises) <p>If you want to refresh your knowledge on all the aforementioned topics, we recommend the following lectures and online resources: Note that some of them go beyond the requirements of this lecture for many topics!</p> <ul style="list-style-type: none"> • Signals and Systems I • Grundlagen der Anatomie und Physiologie für Medizintechniker • Video Series: Introduction to discrete Control (and further videos from this channel, as general introduction to filter and z-plane math) • A visual introduction to Fourier Transform • Udacity Python Course Course materials from the Stanford "Introduction to Scientific Python"

3	Lecturers	Dr. Pavlina Kröckel	

4	Module coordinator	Dr. Pavlina Kröckel
5	Contents	We introduce a variety of topics which will give you a kick start in the field of data science and will help you to continue the learning path in other, more advanced courses. We teach the whole data science process (based on the industry-wide accepted CRISP model) from the business and data understanding to the deployment and management steps. Students get familiar with terms like data science, machine learning, and artificial intelligence, as well as available tools and technologies. You will learn what is behind the technology that powers everything from your shopping suggestions on Amazon to automatic systems like chatbots and self-driving cars. We teach you the most used machine learning algorithms right now: decision trees, neural networks, association rules (Apriori and FP Growth), clustering algorithms (k-Means, DBSCAN).
6	Learning objectives and skills	The students <ul style="list-style-type: none"> • Can describe important business intelligence and data science concepts, tools, and algorithms • Learn how to structure a data science project • Work on a practical exercise and apply the learned algorithms on a real-world dataset • Are able to evaluate a machine learning model and decide on its goodness of fit.
7	Prerequisites	The lecture is intended for students with no prior knowledge in data analytics. Course is limited to 200 participants .
8	Integration in curriculum	semester: 2
9	Module compatibility	Technical Electives Master of Science Advanced Signal Processing & Communications Engineering 20212
10	Method of examination	Klausur (90 Minuten) A pre-requisite to attend the exam is course registration on StudOn . Course participation is limited. Thus, we cannot offer an exam for students not part of the StudOn course.
11	Grading procedure	Klausur (100%)
12	Module frequency	only in summer semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	All relevant material will be provided during the lecture.

1	Module name 96270	Kanalcodierung Channel coding	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Channel Coding (4.0 SWS)	5 ECTS
3	Lecturers	Dr.-Ing. Clemens Stierstorfer	

4	Module coordinator	Dr.-Ing. Clemens Stierstorfer	
5	Contents	1) Introduction and Motivation 2) Fundamentals of Block Coding 3) Introduction to Finite Fields I 4) Linear Block Codes 5) Linear Cyclic Codes 6) Introduction to Finite Fields II 7) BCH and RS Codes 8) Convolutional Codes 9) Codes with Iterative Decoding	
6	Learning objectives and skills	<p>Das Modul Kanalcodierung umfasst eine Einführung in die Grundlagen der algebraischen, fehlerkorrigierenden Blockcodes sowie einen Einstieg in die Thematik der Faltungscodes. Iterativ decodierte Codeschemata wie Turbo-Codes und LDPC-Codes werden ebenfalls eingeführt. Im Einzelnen sind die Inhalte oben aufgeführt.</p> <p>Die Studierenden definieren die Problematik der Kanalcodierung, grenzen sie von anderen Codierv Verfahren (z.B. der Quellencodierung) ab und kennzeichnen die unterschiedlichen Ansätze zur Fehlerkorrektur und -erkennung. Sie nennen Beispiele für Einsatzgebiete von Kanalcodierung und geben einen Überblick über die historische Entwicklung des Fachgebiets.</p> <p>Die Studierenden erstellen Übertragungsszenarien für den Einsatz von Kanalcodierung bestehend aus Sender, Übertragungskanal und Empfänger und beachten dabei die Grundannahmen beim Einsatz von Blockcodes bzw. der Modellierung der Kanäle. Sie formulieren mathematische Beschreibungen der Encodierung sowie der optimalen Decodierung bzw. suboptimaler Varianten.</p> <p>Die Studierenden beherrschen die Grundlagen fehlerkorrigierender linearer Blockcodes, beschreiben diese mathematisch korrekt mittels Vektoren und Matrizen über endlichen Körpern und implementieren und bewerten zugehörige Encoder- und Decoderstrukturen insbesondere Syndromdecoder. Dabei modifizieren sie Generatormatrizen, ermitteln Prüfmatrizen und erstellen Syndromtabellen. Sie schätzen die minimale Hammingdistanz von Codes mittels Schranken ab und können den erzielbaren Codegewinn erläutern. Sie kennen und benutzen beispielhaften Codefamilien (z.B. Hamming-Codes, Simplex-Codes, Reed-Muller-Codes).</p> <p>Die Studierenden erkennen die Vorteile zyklischer linearer Blockcodes und beschreiben diese mit Polynomen über endlichen Körpern. Sie nutzen die Restklassenrechnung bzgl. Polynomen zur Umsetzung systematischer Encoder und zur Realisierung von Syndromdecodern mittels Schieberegisterschaltungen. Sie kennen beispielhafte Codefamilien.</p>	

Die Studierenden nutzen Primkörper, Erweiterungskörper, Minimalpolynome und Kreisteilungsklassen sowie die Spektraldarstellung über endlichen Körpern zur Realisierung von BCH- und Reed-Solomon-Codes gemäß der BCH-Schranke. Sie verstehen die Grundlagen der Decodierung von BCH- und Reed-Solomon-Codes. Sie skizzieren und erläutern die Kanalcodierkonzepte von CD und DVD. Die Studierenden erklären die Unterschiede von Faltungscodes und Blockcodes, skizzieren anhand von tabellierten Generatorpolynomen zugehörige Encoder und erläutern diese. Sie erklären die Funktionsweise des optimalen Decoders (MLSE) und demonstrieren diese beispielhaft.

Die Studierenden verstehen die Grundlagen der iterativen Decodierung, insbesondere wenden sie die Grundlagen des Information Combining zur Kombination von verschiedenen Beobachtungen an. Sie verstehen die Bedeutung von Log-Likelihood-Ratios bei iterativen Decodieruvorgängen und berechnen diese. Sie skizzieren die grundlegenden Encoder- und Decoderstrukturen von Turbo-Codes und die Grundzüge der Codierung mit LDPC-Codes u.a. der Decodierung mittels Belief Propagation.

Die Vorlesung erfolgt wechselweise auf Deutsch oder Englisch (Winter/Sommer). Die zur Verfügung gestellten Unterlagen sind ausschließlich in Englisch gehalten. Die Studierenden verwenden entweder die englischen Fachtermini sicher oder kennen diese und drücken sich sicher mit den entsprechenden deutschen Fachbegriffen aus.

Die Umsetzung der angegebenen Algorithmen in eine Programmiersprache (C, Matlab usw.) sollten die Studierenden zu diesem Zeitpunkt des Studiums üblicherweise beherrschen. Übungen hierzu bleiben der Eigeninitiative überlassen.

Students define the problems of channel coding, how to distinguish it from other coding methods (such as source coding) and how to describe the various different approaches to error correction and detection. They are able to list example application areas of channel coding and give an overview of the historical development of the field.

Furthermore, they describe and analyze transmission scenarios for the application of channel coding which consist of transmitter, transmission channel and receiver, taking into account the general assumptions for applying block codes or modeling the channels. They formulate mathematical descriptions of encoding, optimal decoding and sub-optimal methods.

Students illustrate the principles of error-correcting linear block codes and describe them mathematically using vectors and matrices over finite fields. They implement and analyze corresponding encoder and decoder structures, in particular syndrome decoders, and modify generator matrices, construct test matrices and create syndrome tables. They estimate the minimum Hamming distance of codes using bounds and are able to explain the coding gain that can be achieved in individual cases. They analyze and use example code families (e.g. Hamming codes, simplex codes, Reed-Muller codes).

		<p>Students explain the advantages of cyclic linear block codes and how to describe them with polynomials over finite fields. They apply polynomial modular arithmetic to implement systematic encoders and realize syndrome decoders using shift register circuits. They know and use exemplary code families.</p> <p>Students use prime fields, extension fields, minimal polynomials and cyclotomic cosets, and spectral representation over finite fields to implement BCH and Reed-Solomon codes using the BCH bound. They understand the foundations of decoding BCH and Reed-Solomon codes and how to sketch and explain the channel coding concepts of CDs and DVDs.</p> <p>Students are able to describe the differences between convolutional codes and block codes, to sketch the respective encoders based on tabulated generator polynomials and to explain them. They are able to explain how optimal decoders (MLSE) work using examples.</p> <p>Students sketch the foundations of iterative decoding. In particular, they apply methods of information combining to combine different observations. They use and calculate log-likelihood ratios in iterative decoding processes, sketch the basic encoding and decoding structures of turbo codes and the basics of coding using LDPC codes (including decoding using belief propagation).</p> <p>Students either are able to use the English technical terms correctly or know them and are able to express themselves using the respective technical terms in German.</p>
7	Prerequisites	<p>Es ist hilfreich, wenn die Studierenden die erlernten Algorithmen in eine Programmiersprache (C, Matlab usw.) umsetzen können.</p> <p>It would be very helpful if the participants can implement the specified algorithms into a programming language (C, Matlab, etc.).</p>

5	Contents	<p>Neuroscience has played a key role in the history of artificial intelligence (AI), and has been an inspiration for building human-like AI, i.e. to design AI systems that emulate human intelligence.</p> <p>Neuroscience provides a vast number of methods to decipher the representational and computational principles of biological neural networks, which can in turn be used to understand artificial neural networks and help to solve the so called black box problem. This endeavour is called neuroscience 2.0 or machine behaviour. In addition, transferring design and processing principles from biology to computer science promises novel solutions for contemporary challenges in the field of machine learning. This research direction is called neuroscience-inspired artificial intelligence.</p> <p>The course will cover the most important works which provide the cornerstone knowledge to understand the biological foundations of cognition and AI, and applications in the areas of AI-based modelling of brain function, neuroscience-inspired AI and reverse-engineering of artificial neural networks.</p>
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • Explain the principles of neural information processing in the brain • compare and analyze methods from neuroscience to study neural networks • explain the neuroscientific underpinnings of artificial intelligence • explain principles and concepts of cognitive science • explain principles and concepts of neuroscience • compare and analyze machine learning methods to analyze neural data • explain approaches from deep learning to model brain function • discuss the commonalities of neuroscience and artificial intelligence • implement the presented methods in Python • explain concepts from cognitive neuroscience for the design of artificial intelligence systems

5	Contents	<p>This lecture aims to provide a good background on the concept of compressive sensing and its applications in communications and signal processing.</p> <p>*Part I: Compressive Sensing from the Classical Viewpoint*</p> <p>In the first part, the classic problem of compressive sensing is explained. Important algorithms for sparse recovery in cases with noise-free underdetermined measurements are studied. These algorithms are then modified to address sparse recovery from noisy measurements. Once basic concepts and algorithms are studied, we start with typical analyses in compressive sensing. In this respect, the null space property, restricted isometry property (RIP) and the coherence of a matrix are introduced. Based on these definitions, the concept of recovery guarantee for a sparse recovery algorithm is explained. We then study important recovery guarantees and give some examples of detailed analyses.</p> <p>Finally, we give an introduction to compressive sensing via random matrices and present some key results in this respect.</p> <p>*Part II: Compressive Sensing from a Bayesian Viewpoint*</p> <p>In the second part of the course, we show that compressive sensing can be observed as a Bayesian inference problem. This new viewpoint lets us define the optimal recovery algorithm. We further show that well-known recovery algorithms such as LASSO are interpreted as sub-optimal Bayesian estimators.</p> <p>The key benefit of the Bayesian viewpoint is that it enables us to illustrate approximate message passing (AMP) algorithms: We start with the implementation of a sparse recovery algorithm via the sum-product algorithm and then explain how an AMP algorithm is derived from the sum-product algorithm.</p> <p>The detailed list of contents is as follows:</p> <ul style="list-style-type: none"> • Introduction to Compressive Sensing • Part I: Compressive Sensing from the Classical Viewpoint • Zero-norm minimization • Basis pursuit • Iterative Algorithms • The method of regularized least-squares • Regularization options for sparse recovery • Dantzig selector • Null space property • Coherence of a matrix • Restricted isometry property • Some notes on random matrices

		<ul style="list-style-type: none"> • Generic form of a performance guarantee • Some examples of performance guarantee • Part II: Compressive Sensing from a Bayesian Viewpoint • Posterior distribution • Likelihood in a noisy setting • Sparse prior • Recovery algorithm with minimum mean squared error • Computational complexity of the optimal recovery algorithm • Mismatched prior of LASSO algorithm • Mismatched prior of zero-norm regularization • Implementing a Bayesian algorithm via message passing • Approximating a message passing algorithm for large problems • A sample approximate message passing algorithm
6	<p>Learning objectives and skills</p>	<ul style="list-style-type: none"> • The students understand the concept of sparse recovery. • The students apply sparse recovery to model problems in several applications, such as communication and signal processing systems and machine learning. • The students apply classic approaches to recover sparse signal samples from underdetermined observations. • The students implement most important recovery algorithms in compressive sensing, namely basis pursuit, orthogonal matching pursuit, Lasso and Dantzig algorithm. • The students understand how to regularize the method of least-squares in order perform sparse recovery with it. • The students understand under which condition sparse recovery is successful. • The students understand important properties of sensing matrices, namely null space property, coherence of a matrix and restricted isometry property. • They apply the mentioned properties of sensing matrices to determine the effectiveness of a given sensing matrix. • The students understand the analysis of the success probability of a sparse recovery algorithm and the necessary and sufficient conditions for different algorithms. • The students derive the components of a typical sparse recovery algorithm in a Bayesian inference framework. • In the shadow of the Bayesian interpretation, the students understand the behaviour of different sparse recovery algorithms. • The students understand the theoretically optimal minimum mean square bound for compressive sensing. • The students apply the sum-product algorithm to implement a typical sparse recovery algorithm. • Starting from the sum-product algorithm, the students determine an approximate message passing algorithm via large-system analysis. • The students understand the state-evolution of the approximate message passing algorithm.

5	Contents	This lecture discusses important algorithms from the field of computer vision. The emphasis lies on 3-D vision algorithms, covering the geometric foundations of computer vision, and central algorithms such as stereo vision, structure from motion, optical flow, and 3-D multiview reconstruction. Participants of this advanced course are expected to bring experience from prior lectures either from the field of pattern recognition or from the field of computer graphics.
6	Learning objectives and skills	<p>Die Vorlesung stellt eine Auswahl von Methoden aus dem Gebiet der Computer Vision vor, die in dem Feld eine zentrale Stellung einnehmen. In den Übungen implementieren und evaluieren die Studierenden selbständig diese Methoden. Die Studierenden arbeiten die ganze Zeit über an populären Computer Vision-Methoden wie zum Beispiel Stereosehen, optischer Fluss und 3D-Rekonstruktion aus mehreren Ansichten. Für diese Probleme</p> <ul style="list-style-type: none"> • beschreiben die Studierenden perspektivische Projektion, Rotationen und verwandte geometrische Grundlagen, • erklären die Studierenden die behandelten Methoden, • diskutieren die Studierenden Vor- und Nachteile verschiedener Modalitäten zur Erfassung von 3D-Informationen, • implementieren die Studierenden einzeln und gemeinschaftlich in Kleingruppen Code, • entdecken die Studierenden optimale Vorgehensweisen in der Datenaufnahme, • erkunden und bewerten die Studierenden unterschiedliche Möglichkeiten für die Evaluation, • diskutieren und präsentieren die Gruppenarbeiter in Gruppen die Vor- und Nachteile ihrer Implementierungen, • diskutieren und reflektieren die Studierenden gesellschaftliche Auswirkungen von Anwendungen des 3D-Rechnersehens. <p>The lecture introduces computer vision algorithms that are central to the field. In the exercises, participants autonomously implement and evaluate these algorithms. The participants work throughout the time on popular computer vision algorithms, like for example stereo vision, optical flow, and 3-D multiview reconstruction. For these problems, the participants</p> <ul style="list-style-type: none"> • describe perspective projection, rotations, and related geometric foundations, • explain the presented methods,

		<ul style="list-style-type: none"> • discuss the advantages and disadvantages of different modalities for acquiring 3-D information, • implement individually and in small groups code, • discover best practices in data acquisition, • explore and rank different choices for evaluation, • discuss and present in groups the advantages and disadvantages of their implementations, • discuss and reflect the social impact of applications of computer vision algorithms.

5	Contents	Convex optimization problems are a special class of mathematical problems which arise in a variety of practical applications. In this course we focus on the theory of convex optimization, corresponding algorithms, and applications in communications and signal processing (e.g. statistical estimation, allocation of resources in communications networks, and filter design). Special attention is paid to recognizing and formulating convex optimization problems and their efficient solution. The course is based on the textbook "Convex Optimization" by Boyd and Vandenberghe and includes a tutorial in which many examples and exercises are discussed.
6	Learning objectives and skills	Students <ul style="list-style-type: none"> • characterize convex sets and functions, • recognize, describe and classify convex optimization problems, • determine the solution of convex optimization problems via the dual function and the KKT conditions, • apply numerical algorithms in order to solve convex optimization problems, • apply methods of convex optimization to different problems in communications and signal processing

5	Contents	<p>English Version:</p> <p>This module focuses on recent developments in image processing driven by medical applications. All algorithms are motivated by practical problems. The mathematical tools required to solve the considered image processing tasks will be introduced. The module starts with an overview on preprocessing algorithms such as scatter correction for x-ray images, edge detection, super-resolution and edge-preserving noise reduction. The second chapter describes automatic image analysis using feature descriptors, key point detection, and segmentation using bottom-up algorithms such as the random walker or top-down approaches such as active shape models. Furthermore, the module covers geometric calibration algorithms for single view calibration, epipolar geometry, and factorization. The last part of the module covers non-rigid registration based on variational methods and motion-compensated image reconstruction.</p> <p>Deutsche Version:</p> <p>Das Modul ist auf die jüngsten Entwicklungen in der Verarbeitung von medizinischen Bildern ausgerichtet. Alle Algorithmen werden durch praktische Probleme motiviert. Die mathematischen Werkzeuge, die für die Bildverarbeitungsaufgaben benötigt werden, werden eingeführt. Das Modul beginnt mit einem Überblick über Vorverarbeitungsalgorithmen, wie zum Beispiel Streustrahlkorrektur für Röntgenbilder, Kantenerkennung, Superresolution und kantenerhaltende Rauschunterdrückung. Das zweite Kapitel beschreibt die automatische Bildanalyse mit Merkmalsdeskriptoren, Punkterkennung und Segmentierung mit Bottom-up-Algorithmen wie dem Random-Walker oder Top-Down-Ansätzen wie aktiven Formmodellen. Darüber hinaus deckt die Vorlesung auch geometrische Kalibrierungsalgorithmen zur Einzelansicht-Kalibrierung, Epipolargeometrie und Faktorisierung ab. Der letzte Teil des Moduls deckt nicht-starre Registrierung auf der Grundlage von Variationsmethoden und bewegungskompensierter Bildrekonstruktion ab.</p>

5	Contents	Optical data transmission systems are the enabler for our modern communication networks. Since the first systems have been installed, the transmission capacity as well as the transmission distance has been increased dramatically. The migration from point-to-point transmission systems to complex optical networks is still in progress. The fast evolution of optical transmission technology is stimulated by innovations in the field of the system key components. The lectures concentrate on the physical effects and properties of key components like semiconductor lasers, optical modulators, optical fibers, optical amplifiers and detector diodes. Especially also the nonlinear effects of the transmission fiber are discussed. The main focus is on the effects and characteristics which are important to achieve a certain system performance. The influence of component parameters on system performance is presented in examples related to installed systems and systems that are actually in development. The exercises partly use a numerical simulation tool to analyze the component influence on system performance.
6	Learning objectives and skills	Students <ul style="list-style-type: none"> • Understand structure and operation of components of optical communication systems • Rate the optical properties of components and evaluate the influence of operational parameters on system performance • Are able to analyze the influence of linear and nonlinear fiber effects on optical signals and system performance • Can make use of system simulation tools to engineer optical links
7	Prerequisites	Recommended prior knowledge: <ul style="list-style-type: none"> • Semiconductor physics • Ray optics • Photonics

5	Contents	<p>Recently, in many areas of wireless communications such as wireless sensor networks (WSNs), heterogeneous networks and complex ad hoc networks, distributed graph algorithms and machine learning on graphs are gaining relevance as fundamental tools in network analysis and information processing.</p> <p>This motivates to deliver a general introduction to fundamentals of machine learning such as detection of clusters on graphs. The introduction is followed by the application of machine learning to the design of physical and data layer techniques in wireless communications and in the optimization of mobile networks.</p>	
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • know and explain the fundamentals of machine learning with special attention to machine learning over graphs. • apply these principles in the design and optimisation of wireless communications systems and mobile networks. 	
7	Prerequisites	None

5	Contents	<p>Nach einer Einführung in die Frequenzbereiche und Arbeitsmethoden der Hochfrequenztechnik werden die Darstellung und Beurteilung linearer n-Tore im Wellen-Konzept systematisch hergeleitet und Schaltungsanalysen in der Streumatrix-Darstellung durchgeführt. Bauelemente wie Dämpfungsglieder, Phasenschieber, Richtungsleitungen, Anpassungstransformatoren, Resonatoren und Mehrkreisfilter sowie Richtkoppler und andere Verzweigungs-n-Tore erfahren dabei eine besondere Behandlung, insbesondere in Duplex- und Brückenschaltungen. Rauschen in Hochfrequenzschaltungen wirkt vor allem in Empfängerstufen störend und ist zu minimieren. Antennen und Funkfelder mit ihren spezifischen Begriffen, einschließlich der Antennen- Gruppen bilden einen mehrstündigen Abschnitt. Abschließend werden Hochfrequenzanlagen, vor allem Sender- und Empfängerkonzepte in den verschiedenen Anwendungen wie Rundfunk, Richtfunk, Satellitenfunk, Radar und Radiometrie vorgestellt und analysiert.</p>	
6	Learning objectives and skills	<p>Die Studierenden</p> <ul style="list-style-type: none"> erwerben fundierte Kenntnisse über die typischen passiven HF-Bauelemente sowie den Umgang mit Streuparametern und die Analyse von HF-Schaltungen. lernen Antennenkonzepte und elementare Berechnungsmethoden für Antennen, Funkfelder, Rauschen und HF-Systeme kennen. sind in der Lage, die Kenngrößen und die hochfrequenten Eigenschaften von HF-Bauelementen und Baugruppen sowie Antennen und einfachen HF-Systemen zu berechnen und zu bewerten. 	
7	Prerequisites	<p>Empfohlene Voraussetzungen:</p> <ul style="list-style-type: none"> Passive Bauelemente Elektromagnetische Felder I

5	Contents	<p>Conventional communication systems employ electromagnetic waves for information transmission. This approach is suitable for typical macroscopic applications such as mobile communication. However, newly emerging applications in biology, nanotechnology, and medicine require communication between so-called nano-machines (e.g. nano-robots and nano-sensors) with sizes on the order of nano- and micro-meter. For such device sizes electromagnetic waves cannot be used for efficient information transmission. Instead Molecular Communication, an approach that is also widely used in natural biological systems, has to be applied. In Molecular Communication, transmitter and receiver communicate by exchanging information-carrying molecules. The design of molecular communication systems requires a basic understanding of relevant biological processes and systems as well as their communication-theoretical modelling and analysis. The course is structured as follows: 1) Introduction to Molecular Communication; 2) Biological Nano-Machines; 3) Molecular Communication in Biological Systems; 4) Synthetic Molecular Communication Systems; 5) Mathematical Modelling and Simulation; 6) Communication and Information Theory for Molecular Communication; 7) Design of Molecular Communication Systems; 8) Applications for Molecular Communication Systems.</p>	
6	Learning objectives and skills	<p>The students learn how to design synthetic molecular communication systems. They develop an understanding of natural communication processes in biological systems and how to harness these natural processes for the construction of man-made molecular communication systems. The students also learn how to analyse, model, and simulate molecular communication systems.</p>	
7	Prerequisites	None

5	Contents	<p>Radar is a key technology for a growing number of sensing tasks that range from the detection, location and tracking of moving objects to high-resolution imaging of surfaces, sub-surfaces and 3-D volumes. While the traditional radar applications focused on aerospace security, weather services and traffic surveillance, radar is now becoming a central contactless sensor technology for the automotive sector, medical diagnostics, gesture control, civil engineering, as well as large scale environmental and climate change monitoring, to name only a few. Associated with the new applications is an increasing demand for advanced signal processing techniques to extract the relevant information from the microwave echoes acquired by single- and multi-aperture radar systems in complex environments. This lecture will give an overview of a variety of one-, two-, and three-dimensional radar signal and image processing algorithms and their application for different sensing tasks. The theoretical derivations are complemented by computer examples and simulations that form an integral part of both the lecture and the exercises.</p> <p>The lecture covers the following topics:</p> <ul style="list-style-type: none"> • Introduction (radar principles & applications, signal & noise models, interference, Doppler shift) • Basics of Signal Processing with Python (Jupyter Notebooks) • Data Acquisition (I/Q demodulation, complex signal representation, sampling, quantization) • Range Processing (radar waveforms, pulse compression, ambiguity function, sidelobe reduction) • Doppler Processing (MTI, clutter suppression, range-Doppler ambiguities, spectral estimation) • Detection Theory (target models, Neyman-Pearson criterion, CFAR detector, CRBs) • Multi-Channel Processing (spatial filtering, interference suppression, adaptive beamforming) • Synthetic Aperture Radar (basics of coherent imaging, SAR data model, time-domain processing) • SAR Focusing Algorithms (range-Doppler, chirp scaling, motion compensation, autofocus) • SAR Image Analysis (image statistics, speckle filtering, segmentation, classification) • Radar Polarimetry (wave representations, scattering models, polarimetric decomposition) • Interferometry (interferometric processing chain, statistical performance models, applications)

		<ul style="list-style-type: none"> • Tomography (principles of 3-D imaging, tomographic processing, remote sensing applications) • Space-Time Adaptive Processing (GMTI, optimum processor, pre- & post-Doppler STAP) • Advanced Topics (bi- & multistatic radar, MIMO radar, compressive sensing)
6	Learning objectives and skills	<p>Fachkompetenz</p> <p>Verstehen</p> <ul style="list-style-type: none"> • understand the basic principles and applications of radar systems • understand the statistical properties of SAR images and their combinations • understand current developments associated with bi- and multistatic SAR, MIMO radar, etc. <p>Anwenden</p> <ul style="list-style-type: none"> • implement signal processing algorithms for radar detection and parameter estimation • use performance metrics for the evaluation of radar systems and signal processing algorithms • focus coherent radar raw data into high-resolution SAR images • apply space-time adaptive processing techniques for ground moving target indication <p>Analysieren</p> <ul style="list-style-type: none"> • select and apply spectral processing techniques for clutter and interference suppression • simulate the performance of radar systems in complex environments <p>Erschaffen</p> <ul style="list-style-type: none"> • combine multiple complex-valued SAR images into higher-level information products
7	Prerequisites	Keine formalen Voraussetzungen, aber grundlegende Kenntnisse erforderlich in Signal- und Systemtheorie, Wahrscheinlichkeitstheorie und linearer Algebra. Von Vorteil wären zudem Vorkenntnisse auf einem Teil der folgenden Gebiete: statistische Signalverarbeitung, Hochfrequenztechnik, Radar und/oder nachrichtentechnische Systeme.

3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Ralf Müller
5	Contents	Dual antenna arrays, compressive sensing, Wishart distribution, factor iid model, Kronecker model, convergence of random variables, semi-circle law, quarter circle law, full circle law, Haar distribution, Marchenko-Pastur distribution, Stieltjes transform, Girkos law, unitary invariance, freeness, free convolution, R-transform, free central limit theorem, free Poisson limit theorem, subordination, S-transform, R-diagonal random matrices, R-diagonal free convolution, Haagerup-Larsen law, operator-valued freeness, linearization of noncommutative polynomials, free Fourier transform, self-averaging properties, microscopic vs. macroscopic random variables, quenched random variable, a statistical physics point of view of digital systems, spin glasses, frozen disorder, replica method, replica continuity, replica symmetry, replica symmetry breaking, approximate message passing, classification of np-complete problems
6	Learning objectives and skills	The students find the limiting eigenvalue distributions of various types of random matrices. The students explain Stieltjes, R- and S-transforms. The students explain the limits of various types of fading channels. The students design coding and decoding methods for a given type of multiuser channel. The students perform additive and multiplicative free convolution. The students calculate the asymptotic eigenvalues distributions of given random matrix ensembles. The students construct random matrix ensembles with a given eigenvalue distribution. The students linearize matrix polynomials. The students derive the Boltzmann distribution. The students utilize saddle point integration. The students perform replica calculations. The students explain the meaning of replica symmetry breaking. The students collaborate on solving exercise problems.
7	Prerequisites	Recommended: Good skills in linear algebra, probability theory and complex analysis

1	Module name 43960	Self-Organized Networks Self-organized networks	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Dr.-Ing. Mehdi Harounabadi	
5	Contents	<p>Self-organized networks (2,5 ECTS)</p> <p>Self-organization refers to processes in physical and biological systems which form patterns by interactions of internal parts of the system and/or their interactions with the environment without any form of external interventions. The resulting organization of systems in this case is fully decentralized and distributed over their parts. There are numerous examples of self-organizing systems e.g. flock of birds, neural learning, evolutionary computation, swarm of robots, and self-organizing networks. The principles of self-organization are applied in different communication technologies such as wired and wireless networks. Transport Control Protocol (TCP), Carrier Sense Multiple Access (CSMA), Adaptive Modulation and Coding (AMC) are some examples of self-organized protocols. Besides, Self-Organizing Network (SON) has been defined by 3GPP as the standardization organization of cellular networks. SON refers to the functionality of cellular systems (e.g. 4G and 5G) which enables the system to perform self-configuration, self-optimization and self-healing. Artificial intelligence and mostly machine learning algorithms play an important role in the implementation of SON. This course aims to give you an insight to the self-organization systems and specially self-organizing networks and illustrate the importance of AI and ML in their implementation. The content of this course includes:</p> <ul style="list-style-type: none"> • <ul style="list-style-type: none"> ◦ Self-organizing features and protocols in communication networks <ul style="list-style-type: none"> ◦ In wired networks ◦ In wireless networks § IEEE 802.11 § Ad hoc and sensor networks § UAV networks ◦ Self-Organizing Networks (SON) in 4G and 5G § Self-configuration § Self-optimization § Self-healing Methods for implementation of self-organizing systems ◦ Bio-inspired methods ◦ Artificial intelligence <p>The final exam is in a written form where students should answer to questions based on the lectures, slides and their understating and analysis from the content of the course.</p>

17	Bibliography	<p>Literature review on self-organizing networks (2,5 ECTS)</p> <p>The exercise of this course includes a literature review research project where students work individually on a relevant topic. The steps to accomplish the research project are as follows:</p> <p>A. Select a topic relevant to self-organizing networks and register it by email</p> <p>B. Search for the relevant papers and make a list of papers</p> <p>C. Study the papers and prepare a summary</p> <p>D. Present the outcomes</p>

1	Module name 92374	Seminar on Selected Topics in Machine Learning Seminar: Wireless, radar and microwave techniques	2,5 ECTS
2	Courses / lectures	Seminar: Seminar on Selected Topics in Machine Learning	2,5 ECTS
3	Lecturers	Michele De Vita Prof. Dr. Vasileios Belagiannis Amir El-Ghoussani	

4	Module coordinator	Prof. Dr. Vasileios Belagiannis	
5	Contents	<p>In the seminar "Wireless, Radar and Microwave Techniques", current applications and research work from the field of wireless, radar and microwave technology are dealt with within a framework topic. The topics cover a wide range of modern wireless sensor, localization and communication technologies such as radar applications in traffic, imaging radar and wireless sensors in medical technology.</p> <p>The individual topics that can be worked on within the framework topic are presented in an introductory lecture and assigned to the students. To test presentation techniques, short presentations lasting 5 minutes are given in the second event, followed by a feedback round in which the design aspects are addressed.</p> <p>In the following weeks, each student independently undertakes research on his or her individual topic and prepares a half-hour presentation aimed at an interested professional audience. Each student is individually advised by a member of the department. Each lecture is followed by a 15-minute discussion round in which questions and additions to the previously discussed topic are asked. The lectures are given in weekly succession in the second half of the semester.</p>	
6	Learning objectives and skills	<ul style="list-style-type: none"> • In their research, the students record and organise the state of the art on the chosen framework topic from the field of wireless, radar and microwave techniques. • In doing so, they have to assess the relevance of various aspects of content for the intended audience, and structure the presentation effectively given the time constraints. • They then design and create a scientific/technical presentation that is suitable for effective knowledge transfer in the context of an oral presentation. • For this purpose, they evaluate different presentation options with regard to their comprehensibility. • They clarify questions that arise in the discussion round, and in doing so, explain the issue in question or identify suitable sources that are useful for further clarification. • They become familiar with RF applications and devices using practical examples and gain an insight into current research work in the field of RF technology. 	

		They are thus able to give scientific presentations in front of a specialist audience, to prepare even more complex topics clearly and to convey the specialist knowledge in an understandable way. The skills acquired serve, among other things, as a basis for final presentations in the context of bachelor's and master's theses and provide a foundation for future teamwork in the areas of research, teaching and industry.
7	Prerequisites	At least one of the following modules should be successfully completed: <ul style="list-style-type: none"> • Introduction to Microwave Engineering • Radar, RFID and Wireless Sensor Systems

4	Module coordinator	Prof. Dr. Emanuël Habets	
5	Contents	<p>Description We live in a noisy world! In all applications related to speech, from hands-free communication to human-machine interfaces, a speech signal of interest captured by one or more microphones is contaminated by noise and reverberation. The quality and intelligibility of the signal of interest depend highly on the level of noise and reverberation. Therefore, it is highly desirable, and sometimes even indispensable, to "clean up" the captured signals before storage, transmission, or reproduction.</p> <p>This course discusses both model-driven and data-driven methods to estimate the signal of interest and aims to provide a strong foundation for researchers, engineers, and graduate students interested in signal and speech enhancement.</p> <p>Relation to other courses This course is the most advanced course offered by the university on this topic and serves as an excellent basis from which to commence research in the area. Various aspects of the course bring students up to date with the very latest developments in the field, as seen in recent international conferences and journals. This course is well complimented by Selected Topics in Perceptual Audio Coding (Prof. Herre) and Auditory Models (Prof. Edler).</p>	
6	Learning objectives and skills	<ul style="list-style-type: none"> • Formulate the speech enhancement problem mathematically. • Derive optimal single- and multi-channel filters to reduce noise and reverberation. • Evaluate and compare the performance of single- and multi-channel filters for speech enhancement. • Understand how reference signals and other prior information can be used in a speech enhancement system. • Understand the limitations and challenges of existing speech enhancement systems. • Understand the importance of binaural cues and the influence of a speech enhancement system on the binaural cues in the context of hearing aids. • Design a microphone array and analyze its performance. • Design a speech enhancement system for a given acoustic scenario. 	

		<ul style="list-style-type: none"> Evaluate subjectively and objectively the performance of a speech enhancement system in terms of speech quality and intelligibility.

1	Module name 498723	Transformationen in der Signalverarbeitung Transforms in signal processing	2,5 ECTS
2	Courses / lectures	Vorlesung: Transformationen in der Signalverarbeitung (2.0 SWS)	2,5 ECTS
3	Lecturers	Jürgen Seiler	

4	Module coordinator	Jürgen Seiler
5	Contents	<p>Das Modul "Transformationen in der Signalverarbeitung" behandelt mehrere verschiedene Transformationen, die im Rahmen der Signalverarbeitung Verwendung finden. Dabei werden zuerst die grundlegenden Konzepte von Transformationen diskutiert und die Vorteile die Transformationen mit sich bringen erläutert. Im Anschluss daran werden die grundlegenden Eigenschaften von Integraltransformationen betrachtet und die Laplace- und die Fourier-Transformation im Detail untersucht. Um auch zeitlich veränderliche Signale gut transformieren zu können werden danach die Kurzzeit-Fourier-Transformation und die Gabor-Transformation eingeführt. Im Anschluss daran erfolgt eine Betrachtung der Auswirkung der Abtastung auf transformierte Signale, bevor die z-Transformation als Transformation für diskrete Signale behandelt wird. Abschließend erfolgt die Betrachtung weiterer Transformationen für diskrete Signale wie der Diskreten Fourier-Transformation oder linearer Block-Transformationen. The module "Transforms in Signal Processing" covers several different transforms which are used in the field of signal processing. For this, first the basic concepts of transforms are discussed and the advantages which are offered by the different transforms are presented. Subsequent to this, fundamental properties of integral transforms are considered and the Laplace- and the Fourier-Transform are examined in detail. To be able to transform time-varying signals, the Short-Time Fourier-Transform and the Gabor-Transform are introduced, afterwards. Subsequent to this, the impact of sampling on transformed signals is analyzed before the z-Transform as a transform for discrete signals is covered. Finally, further transforms for discrete signals like the Discrete Fourier-Transform or Linear-Block Transforms are discussed.</p>
6	Learning objectives and skills	<p>Die Studierenden können nach Besuch der Vorlesung</p> <ul style="list-style-type: none"> • Anwendungsmöglichkeiten von Transformationen bestimmen • Integraltransformationen gegenüberstellen und untersuchen • die Existenz von Transformationen hinterfragen • die Eindeutigkeit von Transformationen überprüfen • Sätze und Eigenschaften von Transformationen entwickeln • zu Transformationen zugehörige inverse Transformationen einschätzen • die Zusammenhänge zwischen verschiedenen Transformationen einschätzen • auf Zusammenhänge zwischen Ausgangssignalen und transformierten Signalen folgern • Symmetriebeziehungen von Transformationen ausarbeiten

		<ul style="list-style-type: none"> Zusammenhänge zwischen kontinuierlichen und diskreten Signalen ausarbeiten <p>Educational Objectives and Competences: After attending the lecture, students will be able to</p> <ul style="list-style-type: none"> determine applications of transforms contrast and examine integral transforms question the existence of transforms evaluate the uniqueness of transforms develop theorems and properties of transforms evaluate to transforms corresponding inverse transforms evaluate the relationships between different transforms asses the relationship between original signal and transformed signals devise the symmetry properties of transforms devise the relationship between continuous and discrete signals
7	Prerequisites	None
8	Integration in curriculum	no Integration in curriculum available!
9	Module compatibility	Technical Electives Master of Science Advanced Signal Processing & Communications Engineering 20212
10	Method of examination	mündlich
11	Grading procedure	mündlich (100%)
12	Module frequency	only in summer semester
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: 30 h Independent study: 45 h

5	Contents	<p>The aim of this lecture is that the students acquire a basic knowledge of advanced transmission and detection techniques which are relevant to practical mobile communications systems. In the first part, it is shown how equalization schemes like decision-feedback equalization (DFE) and maximum-likelihood sequence estimation (MLSE) can be applied to the GSM/EDGE (Enhanced Data Rates for GSM Evolution) standard. Also, channel estimation for GSM/EDGE is covered. In GSM/EDGE, disturbance by interfering signals of other users is a further major problem. Therefore, interference cancellation algorithms are discussed in detail. The cases of several receive antennas and one receive antenna (single antenna interference cancellation) are distinguished. Several receive antennas can be also utilized for increasing the robustness against fading, applying diversity combination techniques. In the case of the availability of several transmit antennas only, additional space-time coding has to be used for realization of diversity gains. These aspects are also discussed in depth. Furthermore, an introduction to code-division multiple access (CDMA) transmission is given and it is shown how CDMA is applied in the UMTS system. The lecture is concluded by an introduction to digital transmission in the Long Term Evolution (LTE) system.</p>	
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • describe basic equalization algorithms such as decision-feedback equalization (DFE) and maximum-likelihood sequence estimation (MLSE), • apply equalization algorithms to the GSM / Enhanced Data Rates for GSM Evolution (EDGE) mobile communication system, • formulate channel estimation methods for mobile communication systems, • characterize the interference problem in GSM / EDGE, <p>- design interference suppression schemes for GSM/EDGE for receivers with a single antenna (single antenna interference cancellation) and multiple antennas, respectively,</p> <ul style="list-style-type: none"> • characterize the performance of mobile communication networks for different reception schemes, • devise receivers for the realization of diversity gains for multiple receive antennas, • design space-time coding schemes for the realization of diversity gains for multiple transmit antennas, 	

		<ul style="list-style-type: none"> describe transmission schemes which are based on code-division multiple access (CDMA), apply reception techniques for CDMA to the UMTS system, characterize the uplink transmission in the Long Term Evolution (LTE) system, develop receivers for LTE. <p>Die Studierenden</p> <ul style="list-style-type: none"> beschreiben grundlegende Entzerrverfahren wie entscheidungsrückgekoppelte Entzerrung (Decision-Feedback Equalization, DFE) und Maximum-Likelihood-Sequenzschätzung (Maximum-Likelihood Sequence Estimation, MLSE), wenden Entzerrverfahren auf das GSM/EDGE (Enhanced Data Rates for GSM Evolution) Mobilfunksystem an, formulieren Kanalschätzverfahren für Mobilfunksysteme, charakterisieren das Interferenzproblem bei GSM/EDGE, entwerfen Interferenzunterdrückungsverfahren für GSM/EDGE für Empfänger mit einer Antenne (Single Antenna Interference Cancellation) und mehreren Antennen, bewerten die Leistungsfähigkeit von Mobilfunknetzen bei Einsatz verschiedener Empfangsverfahren, konzipieren Empfänger zur Realisierung von Diversitätsgewinnen bei empfangsseitiger Antennendiversität entwerfen Space-Time-Codierverfahren zur Realisierung von Diversitätsgewinnen bei sendeseitiger Antennendiversität, beschreiben auf Code-Division Multiple Access (CDMA) basierende Übertragungsverfahren, wenden Empfangsverfahren für CDMA auf das UMTS-System an, charakterisieren die Aufwärtsstrecke von Long Term Evolution (LTE), entwerfen Empfänger für LTE.
