

# Module description

for the degree programme

Master of Science

Autonomy Technologies

(Version of examination regulation: 20232)

for the winter term 2025/2026

# Table of contents

|                                                                               |     |
|-------------------------------------------------------------------------------|-----|
| Master's thesis (1999).....                                                   | 5   |
| Team project or Industriepraktikum (1996).....                                | 7   |
| Human-system Interfaces - core modules                                        |     |
| Human-centered mechatronics and robotics (92345).....                         | 9   |
| Robot mechanisms and user interfaces (92359).....                             | 11  |
| Human Computer Interaction (645618).....                                      | 13  |
| Intent Detection and Feedback (47616).....                                    | 16  |
| Human-system Interfaces - specialization module                               |     |
| Image and Video Compression (96310).....                                      | 19  |
| Image, Video, and Multidimensional Signal Processing (92343).....             | 22  |
| Body Area Communications (816185).....                                        | 25  |
| Human-Robot Co-Adaptation (47623).....                                        | 27  |
| Rehabilitation and Assistive Robotics (47617).....                            | 29  |
| AI in medical robotics (93101).....                                           | 31  |
| Robotics in Surgery and Diagnostics (47708).....                              | 33  |
| Surgical Technologies Innovation (44159).....                                 | 35  |
| A look inside the human body - gait analysis and simulation (96837).....      | 37  |
| Networking & Collaboration - core modules                                     |     |
| Digital Communications (47800).....                                           | 40  |
| Information Theory and Coding (48410).....                                    | 42  |
| MIMO Communication Systems (96300).....                                       | 45  |
| Machine Learning in Communications (668129).....                              | 47  |
| Networking & Collaboration - specialization module                            |     |
| Image and Video Compression (96310).....                                      | 49  |
| Communications Systems Design (700506).....                                   | 52  |
| Cyber-Physical Systems (636348).....                                          | 54  |
| Mobile Communications (43141).....                                            | 56  |
| Multiuser Information and Communications Theory (687141).....                 | 58  |
| Random Matrices in Communications and Signal Processing (451971).....         | 60  |
| Channel Coding on Graphs (412023).....                                        | 62  |
| Advanced Communication Networks (151664).....                                 | 65  |
| Convex Optimization in Communications and Signal Processing (96850).....      | 69  |
| Transmission and Detection for Advanced Mobile Communications (43420).....    | 71  |
| Approximate Computing (965820).....                                           | 74  |
| Next Generation Mobile Communication Systems: 5G-Advanced and 6G (96065)..... | 76  |
| Planning & Control - core modules                                             |     |
| Robotics 1 (92519).....                                                       | 79  |
| Nonlinear Control Systems (92529).....                                        | 81  |
| Numerical Optimization and Model Predictive Control (92528).....              | 83  |
| Introduction to Deep Learning (43405).....                                    | 85  |
| Planning & Control - specialization module                                    |     |
| Regelungstechnik B (Zustandsraummethoden) (97060).....                        | 88  |
| Robotics 2 (92535).....                                                       | 91  |
| Digitale Regelung (97360).....                                                | 93  |
| Schätzverfahren in der Regelungstechnik (94961).....                          | 95  |
| Ereignisdiskrete Systeme (92430).....                                         | 96  |
| Statistical Signal Processing (96430).....                                    | 98  |
| Machine Learning in Signal Processing (48440).....                            | 100 |
| Pattern Analysis (44120).....                                                 | 102 |
| Pattern Recognition (44130).....                                              | 104 |

|                                                                                          |     |
|------------------------------------------------------------------------------------------|-----|
| Reinforcement Learning (93185).....                                                      | 107 |
| Grundlagen der Robotik (94951).....                                                      | 109 |
| Robotics Frameworks (92880).....                                                         | 111 |
| Verteilte Systeme (95280).....                                                           | 113 |
| Advanced Topics in Deep Learning (42800).....                                            | 116 |
| Legged Locomotion of Robots (LLR) (47656).....                                           | 118 |
| A look inside the human body - gait analysis and simulation (96837).....                 | 120 |
| Gait analysis and simulation+ (47575).....                                               | 122 |
| Sensing & Perception - core modules                                                      |     |
| Radar, RFID and Wireless Sensor Systems (RWS) (96316).....                               | 125 |
| Statistical Signal Processing (96430).....                                               | 127 |
| Image, Video, and Multidimensional Signal Processing (92343).....                        | 129 |
| Machine Learning in Signal Processing (48440).....                                       | 132 |
| Sensing & Perception - specialization module                                             |     |
| Image and Video Compression (96310).....                                                 | 135 |
| Computational Visual Perception (93173).....                                             | 138 |
| Radar Signal Processing (44400).....                                                     | 140 |
| Advanced Optical Communication Systems (621649).....                                     | 143 |
| Waveguides, optical fibres and photonic crystal fibres (67145).....                      | 145 |
| Perception in Robotics (42801).....                                                      | 147 |
| Speech and Language Processing (44455).....                                              | 149 |
| Transformationen in der Signalverarbeitung (498723).....                                 | 151 |
| Computer vision (713618).....                                                            | 153 |
| Linear and non-linear fibre optics (267499).....                                         | 155 |
| Human-system Interfaces - Seminar & laboratory                                           |     |
| Laboratory course Human-Robot Interaction (92507).....                                   | 158 |
| Seminar: Autonomous systems and mechatronics (92346).....                                | 160 |
| Seminar: Human-robot interaction (47667).....                                            | 161 |
| Seminar: The why and how of human gait simulations (47595).....                          | 162 |
| Networking & Collaboration - Seminar & laboratory                                        |     |
| Laborpraktikum Multimediakommunikation (97651).....                                      | 164 |
| Laboratory course: Digital signal processing (92335).....                                | 166 |
| Seminar: Selected topics of multimedia communications and signal processing (92336)..... | 168 |
| Joint communications and sensing in wireless systems (92527).....                        | 170 |
| Laboratory course: Mobile communication (97640).....                                     | 172 |
| Laborpraktikum Digitale Signalverarbeitung (97520).....                                  | 175 |
| Smart City: Technologies and systems (TuS) (92361).....                                  | 177 |
| Digital communication Lab (93511).....                                                   | 179 |
| Laboratory course: Communications systems design (92356).....                            | 183 |
| Lab course machine learning in signal processing (878210).....                           | 185 |
| Planning & Control - Seminar & laboratory                                                |     |
| Laboratory course: Automatic Control I (92338).....                                      | 188 |
| Laboratory course: Automatic Control II (92339).....                                     | 190 |
| Lab course machine learning in signal processing (878210).....                           | 192 |
| Seminar: Modern control methods (92341).....                                             | 194 |
| Seminar: Mobile robotics (92342).....                                                    | 195 |
| Seminar on Selected Topics in Machine Learning (92374).....                              | 196 |
| Legged locomotion of robots (LLR) (47656).....                                           | 198 |
| Sensing & Perception - Seminar & laboratory                                              |     |
| Laborpraktikum Multimediakommunikation (97651).....                                      | 200 |
| Laboratory course: Digital signal processing (92335).....                                | 202 |
| Lab course machine learning in signal processing (878210).....                           | 204 |

|                                                                                                |     |
|------------------------------------------------------------------------------------------------|-----|
| Seminar: Selected topics of multimedia communications and signal processing<br>(92336).....    | 206 |
| Laborpraktikum Digitale Signalverarbeitung (97520).....                                        | 208 |
| Laboratory course: Image and video signal processing on embedded platforms<br>(97525).....     | 210 |
| Seminar on selected topics of multimedia communications and signal processing<br>(914949)..... | 212 |
| Seminar on Selected Topics in Machine Learning (92374).....                                    | 214 |
| Laboratory course: Sensor technology (97690).....                                              | 216 |

|   |                            |                                                                               |                |
|---|----------------------------|-------------------------------------------------------------------------------|----------------|
| 1 | <b>Module name</b><br>1999 | <b>Master thesis (M.Sc. Autonomy Technologies 20232)</b><br>Master's thesis   | <b>30 ECTS</b> |
| 2 | Courses / lectures         | No courses / lectures available for this module!                              |                |

Markus Jonscher                                                                                                                                                                                                                                                                                                                           |
| 5  | <b>Contents</b>                          | The team project comprises (some of) the following aspects to be tackled in a team of 4-5 students:<br>Research and development of autonomous systems and their components<br>Requirement analysis<br>Modeling, simulation, and optimization<br>Experimental evaluation<br>Accordingly, not only technical but also management and soft skills are to be explored and to be acquired. |
| 6  | <b>Learning objectives and skills</b>    | Students learn to apply the knowledge acquired during their Autonomy Technology studies to real-world engineering challenges. They systematically identify solutions to implement components and/or systems and optimize them. Moreover, they learn to act as a team, manage joint development processes, and practice to present, critically discuss, and document their results.    |
| 7  | <b>Prerequisites</b>                     | None                                                                                                                                                                                                                                                                                                                                                                                  |

Philipp Beckerle<br>Mehmet Ege Cansev                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5  | <b>Inhalt</b>                            | <p>Mechanical components, short overview/repetition of machine elements, Robot mechanisms, Kinematic parameters and calculations, Evaluation metrics and design methods, Redundant mechanisms and actuation, Human-robot interfaces, Intend detection (sensing) and haptic stimulation (actuators), Interface system design and evaluation, Mechanical and cognitive user models</p> <p>A flip-the-classroom seminar with student presentations and discussion is part of the lecture. The laboratory exercise will be a mini design project in which student groups create their own low-budget haptic human-machine interfaces.</p> |
| 6  | <b>Lernziele und Kompetenzen</b>         | On successful completion of this module, students will be able to: Understand robot mechanisms and apply kinematic calculations for their design and control, Exploit redundancy in kinematic chains and actuation systems, Know components of human-machine interfaces and be able to design such systematically, Know approaches to model human characteristics and behavior for human-machine interface design.                                                                                                                                                                                                                    |
| 7  | <b>Voraussetzungen für die Teilnahme</b> | Keine                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 5 | <b>Inhalt</b>                 | <p>Das Modul vermittelt Konzepte, Prinzipien, Modelle, Methoden und Techniken für die effektive Entwicklung von benutzerfreundlichen Mensch-Computer-Schnittstellen. Das Thema moderner Benutzungsschnittstellen wird dabei für klassische Computer aber auch für mobile Geräte, eingebettete Systeme, Automobile und intelligente Umgebungen betrachtet.</p> <p>Die folgenden Themen werden im Modul behandelt:</p> <ul style="list-style-type: none"> <li>• Einführung in die Grundlagen der Mensch-Computer-Interaktion, historische Entwicklung</li> <li>• Entwurfsprinzipien und Modelle für moderne Benutzungsschnittstellen und interaktive Systeme</li> <li>• Informationsverarbeitung des Menschen, Wahrnehmung, Motorik, Eigenschaften und Fähigkeiten des Benutzers</li> <li>• Interaktionskonzepte und -stile, Metaphern, Normen, Regeln und Style Guides</li> <li>• Ein- und Ausgabegeräte, Entwurfsraum für interaktive Systeme</li> <li>• Analyse-, Entwurfs- und Entwicklungsmethoden und -werkzeuge für Benutzungsschnittstellen</li> <li>• Prototypische Realisierung und Implementierung von interaktiven Systemen, Werkzeuge</li> <li>• Architekturen für interaktive Systeme, User Interface Toolkits und Komponenten</li> <li>• Akzeptanz, Evaluationsmethoden und Qualitätssicherung</li> </ul> <p>Contents:<br/>The module aims to teach basic knowledge of concepts, principles, models, methods and techniques for developing highly user-friendly Human-Computer Interfaces. Beyond traditional computer systems, modern user interfaces are also discussed in the context of automobile and intelligent environments, mobile devices and embedded systems. This module addresses the following topics:</p> <ul style="list-style-type: none"> <li>• Introduction to the basics of Human-Computer Interaction</li> <li>• Design principles and models for modern user interfaces and interactive systems</li> <li>• Information processing of humans, perception, motor skills, properties and skills of the users</li> </ul> |

| 5 | <b>Inhalt</b>                            | <p>This module is concerned with artificial intelligence technologies in medical robotics and with methods that establish different forms of intelligence in medical robotic systems. Participants will become familiar with the design and application of AI methods and algorithms for perception, motor control, planning, cognition and learning and with their application in biorobotic systems and robotic solutions for diagnosis and treatment. Application domains include minimally invasive surgery, motor rehabilitation, exoskeletons and assistive devices, as well as medical service robotics. The taught methods will be applied to application data during designated computer exercises that are integrated into the course.</p> <p>Topics include, but are not limited to:</p> <ul style="list-style-type: none"> <li>• Basic principles and classification of artificial intelligence</li> <li>• Overview of AI methods and technologies in medical imaging</li> <li>• Implications of surgical workflow planning using AI methods</li> <li>• Motion planning in robotic surgery, rehabilitation robots and medical service robots</li> <li>• Perception in robotic surgery, rehabilitation robots and assistive robots</li> <li>• Motion planning in robotic surgery, rehabilitation robots and assistive robots</li> <li>• Adaptation and Learning in Human-Robot Interaction</li> <li>• Design criteria and regulations for AI-based medical systems</li> </ul> |  |
| 6 | <b>Lernziele und Kompetenzen</b>         | <ul style="list-style-type: none"> <li>• Students are able to employ artificial intelligence technologies and methods for applications in medical robotics.</li> <li>• They are capable of understanding and handling the complexity of biorobotic AI systems and have command of a versatile set of methods for analyzing and further advancing such systems.</li> <li>• They are able to combine different tools and methods to achieve intelligent perception, planning, control, learning and cognition in robotic solutions for minimally invasive surgery, motor rehabilitation robotics, and medical service robotics.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 7 | <b>Voraussetzungen für die Teilnahme</b> | Participants should be familiar with fundamentals of linear algebra. It is advantageous but not required to have some prior knowledge on robotics, basic methodologies of AI, and basic probability theory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
| 8 | <b>Einpassung in Studienverlaufsplan</b> | Semester: 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |

| 5 | <b>Inhalt</b>                    | <p>To provide motivation, the various scenarios of robot use in the surgical environment are explained and classified using examples. The fundamentals of robotics are addressed, including different kinematic forms, and key parameters such as degrees of freedom, kinematic chains, workspace, and payload are introduced. This includes the presentation of medically used robots in different size scales, ranging from micro- and nanorobotics to minimally invasive continuum robotics and larger systems for robot-assisted surgery.</p> <p>Next, the different modules of the process chain for robot-assisted surgery are presented. It begins with medical imaging and the various tomographic techniques, explaining their physical principles and their diagnostic information about anatomy and pathology. Medical image processing, with a focus on segmentation, follows. This leads to the geometric 3D reconstruction of anatomical structures, forming the basis for an attributed patient model. The methods for registering preprocessed measurement data from different tomographic modalities are described. The various approaches for modeling tissue parameters complement the discussions, forming a complete patient model. The applications of the patient model in visualization and surgical planning are the next topic. The intraoperative part of the process chain includes registration, navigation, augmented reality, and surgical robotic systems. These are explained with fundamentals and application examples. Key points here include techniques for robot-assisted tissue cutting and approaches to micro- and nanosurgery. Finally, applications of machine learning in medical robotics are discussed. The lecture concludes with a brief discourse on specific safety issues and the legal aspects of medical products.</p> |  |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Students</p> <ul style="list-style-type: none"> <li>• have a good overview of existing surgical and medical robotic systems in research and practical applications.</li> <li>• understand the specific requirements of surgery for automation with robots.</li> <li>• can recognize basic kinematics and their relevance to medical requirements and applications.</li> <li>• are familiar with basic techniques for processing and using image data from different modalities and can apply them.</li> <li>• can design the complete workflow for a robot-assisted procedure.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |

| 5 | <b>Inhalt</b>                            | <p>The module involves theoretical and practical course work. Interactive lectures will provide introduction to medical technologies, surgical robotics and machine learning for surgical applications.</p> <p>In addition, through lectures, experts from several surgical disciplines (e.g. Neurosurgery, Abdominal surgery, Urology, Orthopedic surgery) will introduce their surgical fields and point out current challenges in their respective fields.</p> <p>During hospitations at the operation room, students gain understanding about surgeries and are to identify problems and worksteps that may be solved and/or supported by novel medical technologies.</p> <p>In exercise teams, the students will research and develop technologies to support surgeons in the respective surgical discipline and evaluate them in the lab.</p> <p>If successful, students are encouraged to submit and present their work at a medical technologies conference.</p> |

| 5  | <b>Inhalt</b>                            | <p>The aim of this lecture is to teach methods of gait analysis and simulation. Gait analysis experiments will be covered, as well as more modern approaches to gather walking data. Techniques to process gait analysis experiments are discussed, as well as dynamic models that can be used to create gait simulations. This lecture addresses the following topics:</p> <ul style="list-style-type: none"> <li>• Measurement systems for gait analysis</li> <li>• Methods to calculate joint kinetics and kinematics from experimental data</li> <li>• Muscle biology, specific to force generation, and modelling of muscles</li> <li>• Methods to calculate muscle activation from experimental data</li> <li>• Energetics of walking</li> <li>• Multibody dynamics</li> <li>• Creating simulations of gait</li> </ul> |

| 5 | <b>Inhalt</b>                    | <p>Alle modernen Kommunikationssysteme basieren auf digitalen Übertragungsverfahren.</p> <p>Diese Vorlesung befasst sich mit den Grundlagen der Analyse und des Entwurfs digitaler Sender und Empfänger. Dabei wird zunächst von einem einfachen Kanalmodell bei dem das Empfangssignal nur durch additives weißes Gaußsches Rauschen gestört wird ausgegangen. Im Verlauf der Vorlesung werden aber auch Kanäle mit unbekannter Phase sowie verzerrende Kanäle betrachtet. Behandelt werden unter anderem digitale Modulationsverfahren (z.B. Pulsamplitudenmodulation (PAM), digitale Frequenzmodulation (FSK), und Kontinuierliche-Phasenmodulation (CPM)), Orthogonalkonstellationen, das Nyquistkriterium in Zeit- und Frequenzbereich, optimale kohärente und inkohärente Detektions- und Decodierungsverfahren, die Signalraumdarstellung digital modulierter Signale, verschiedene Entzerrungsverfahren, und Mehrträger-Übertragungsverfahren.</p> <p>---</p> <p>Modern communication systems are based on digital transmission methods.</p> <p>This course covers basics of analysis and design of digital transmitters and receivers.</p> <p>Initially, we consider a simple channel model whose received signal is impaired only by additive white Gaussian noise. Then, we extend fundamental concepts to channels with unknown phases and distortion. Additionally, we treat digital modulation techniques, e.g., pulse amplitude modulation (PAM), digital frequency modulation (FSK) and continuous-phase modulation (CPM), and orthogonal constellations. The Nyquist criterion in time and frequency domain, optimal coherent and incoherent detection and decoding methods, signal space representations of digitally modulated signals, various equalization methods, and multicarrier transmission methods are also discussed.</p> |

Ralf Müller                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5 | <b>Inhalt</b>                 | <p>1. Introduction: binomial distribution, (7,4)-Hamming code, parity-check matrix, generator matrix</p> <p>2. Probability, entropy, and inference: entropy, conditional probability, Bayes law, likelihood, Jensens inequality</p> <p>3. Inference: inverse probability, statistical inference</p> <p>4. The source coding theorem: information content, typical sequences, Chebychev inequality, law of large numbers</p> <p>5. Symbol codes: unique decidability, expected codeword length, prefix-free codes, Kraft inequality, Huffman coding</p> <p>6. Stream codes: arithmetic coding, Lempel-Ziv coding, Burrows-Wheeler transform</p> <p>7. Dependent random variables: mutual information, data processing lemma</p> <p>8. Communication over a noisy channel: discrete memory-less channel, channel coding theorem, channel capacity</p> <p>9. The noisy-channel coding theorem: jointly-typical sequences, proof of the channel coding theorem, proof of converse, symmetric channels</p> <p>10. Error-correcting codes and real channels: AWGN channel, multivariate Gaussian pdf, capacity of AWGN channel</p> <p>11. Binary codes: minimum distance, perfect codes, why perfect codes are bad, why distance isnt everything</p> <p>12. Message passing: distributed counting, path counting, low-cost path, min-sum (=Viterbi) algorithm</p> <p>13. Exact marginalization in graphs: factor graphs, sum-product algorithm</p> <p>14. Low-density parity-check codes: density evolution, check node degree, regular vs. irregular codes, girth</p> <p>15. Lossy source coding: transform coding and JPEG compression</p> <p>--</p> <p>1. Einleitung: Binomialverteilung, (7,4)-Hamming-Code, Paritätsmatrix, Generatormatrix</p> <p>2. Wahrscheinlichkeit, Entropie und Inferenz: Entropie, bedingte Wahrscheinlichkeit, Bayessches Gesetz, Likelihood, Jensensche Ungleichung</p> <p>3. Inferenz: Inverse Wahrscheinlichkeit, statistische Inferenz</p> <p>4. Das Quellencodierungstheorem: Informationsgehalt, typische Folgen, Tschebyschevsche Ungleichung, Gesetz der großen Zahlen</p> <p>5. Symbolcodes: eindeutige Dekodierbarkeit, mittlere Codewortlänge, präfixfreie Codes, Kraftsche Ungleichung, Huffmancodierung</p> |

|   |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 5 | <b>Inhalt</b>                            | Modern communication systems employ multiple antennas at the transmitter and/or receiver creating a multiple-input multiple-output (MIMO) system. This course covers the fundamental mathematical and communication theoretical concepts necessary for the design and analysis of MIMO communication systems. Relevant topics include MIMO Channel Capacity, Receive Diversity, Transmit Diversity, Space-Time Coding, Spatial Multiplexing, MIMO Transceiver Design, Multi-user MIMO, Massive MIMO, Relay-based MIMO, and applications in modern communication systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 6 | <b>Lernziele und Kompetenzen</b>         | <p>The students</p> <ul style="list-style-type: none"> <li>• learn about different MIMO channel models,</li> <li>• analyze MIMO communication systems with respect to their channel capacity and reliability,</li> <li>• determine MIMO figures of merit such as coding gain, diversity gain, and multiplexing gain,</li> <li>• compare and evaluate different MIMO receiver designs,</li> <li>• characterize the rate region of multiuser systems,</li> <li>• analyze massive MIMO systems,</li> <li>• discuss the advantages and disadvantages of different relay network architectures.</li> </ul> <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• lernen verschiedene MIMO-Kanalmodelle kennen,</li> <li>• analysieren MIMO-Kommunikationssysteme hinsichtlich der Kanalkapazität und Zuverlässigkeit,</li> <li>• ermitteln MIMO-Kenngrößen wie Codierungsgewinn, Diversitätsgewinn und Multiplexgewinn,</li> <li>• vergleichen und beurteilen verschiedene MIMO-Empfangsstrategien,</li> <li>• charakterisieren die Ratenregion von Mehrteilnehmersystemen,</li> <li>• analysieren Massive-MIMO-Systeme,</li> <li>• diskutieren die Vor- und Nachteile verschiedener Relaisnetzwerkarchitekturen.</li> </ul> |  |
| 7 | <b>Voraussetzungen für die Teilnahme</b> | Basic course in communications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| 8 | <b>Einpassung in Studienverlaufsplan</b> | Semester: 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |

| 5  | <b>Inhalt</b>                            | <p>Recently, in many areas of wireless communications such as wireless sensor networks (WSNs), heterogeneous networks and complex ad hoc networks, distributed graph algorithms and machine learning on graphs are gaining relevance as fundamental tools in network analysis and information processing.</p> <p>This motivates to deliver a general introduction to fundamentals of machine learning such as detection of clusters on graphs. The introduction is followed by the application of machine learning to the design of physical and data layer techniques in wireless communications and in the optimization of mobile networks.</p> |

| 4  | <b>Modulverantwortliche/r</b>            | Dr.-Ing. Torsten Klie                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
| 5  | <b>Inhalt</b>                            | <p>Klassische Computersysteme zeichnen sich durch eine strikte Trennung von realer und virtueller Welt aus. Moderne Steuerungssysteme, die z.B. in modernen Fahrzeugen verbaut sind und die aus einer Vielzahl von Sensoren und Aktoren bestehen, entsprechen diesem Bild nur sehr eingeschränkt.</p> <p>Diese Systeme, oft "Cyber-Physical Systems (CPS)" genannt, erkennen ihre physische Umgebung, verarbeiten diese Informationen und können die physische Umwelt auch koordiniert beeinflussen. Hierzu ist eine starke Kopplung von physischem Anwendungsmodell und dem Computer-Steuerungsmodell nötig. Im Unterschied zu Eingebetteten Systemen bestehen CPS meist aus vielen vernetzten Komponenten, die sich selbständig untereinander koordinieren.</p> <p>Diese Vorlesung spannt den Bogen von kontrolltheoretischen Grundlagen über Selbstorganisationsprinzipien bis hin zu visionären Anwendungen aus den Bereichen Verkehr und Medizintechnik. Ferner werden Entwurfsmethoden für Cyber-Physical Systems vorgestellt.</p> |  |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>Die Studierenden erläutern, was Cyber-Physical Systems sind und auf welchen technologischen Grundlagen sie aufbauen, insbesondere in den Bereichen Regelungstechnik, Ablaufplanung, Kommunikation und Selbstorganisation bewerten CPS in verschiedenen Anwendungsgebieten</p> <p>stellen den Entwurfsprozess von CPS dar, insbesondere die Modellierung und die grundlegende Programmierung entdecken</p> <p>wesentliche Herausforderungen beim Entwurf, Ausbringung und Einsatz von CPS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |

| 4  | <b>Modulverantwortliche/r</b>            | Prof. Dr.-Ing. Ralf Müller                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 5  | <b>Inhalt</b>                            | History of mobile communications, cellular systems, sectorization, spectral efficiency, co-channel interference, adjacent-channel interference, near-far effect, cellular network architecture, antenna types and parameters, free space propagation, reflection, attenuation, diffraction, scattering, classification of channel models, ground reflection model, Okumura-Hata model, shadowing, narrow-band fading, time-variant channels, scattering function, delay-Doppler spectrum, diversity principles, combining methods, diversity gain, multiplexing, duplexing, digital modulation, Gaussian filtered minimum shift keying, basics of channel coding, interleaving, global system for mobile communications, physical versus logical channels, frame structure, call set-up, synchronization, channel estimation, hand-off                                                                                                                        |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>The students explain the cellular structure of mobile communication systems. They students explain the physical mechanics of radio wave propagation in the cm-band. The students explain the GSM cellular communications standard. The students discuss the pros and cons of several multiple-access and duplexing methods. The students discuss the pros and cons of several modulation and coding formats.</p> <p>The students decide which antenna type is suitable for a given morphological structure of the environment. The students predict the amplitude and dynamic of the attenuation between a mobile transmitter and a fixed receiver. The students utilize diversity methods to improve the link quality. The students determine the coverage probability of a given cellular communication system.</p> <p>The students collaborate on solving exercise problems. The students discuss which system solutions fit to which environments.</p> |

| 4  | <b>Modulverantwortliche/r</b>            | Prof. Dr.-Ing. Ralf Müller                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5  | <b>Inhalt</b>                            | Linear vs. nonlinear multiple-access, CDMA as a canonical framework for any multiple-access schemes, optimum multiuser detection, linear multiuser detection, interference cancellation, rate region, multiuser source coding, time sharing, multiuser channel codes, multiple-access channel (MAC), capacity region, mutual information versus minimum-mean squared error, Gaussian MAC, power region, Gaussian vector MAC, source coding with side information, degraded broadcast channel, Gaussian broadcast-MAC duality, Gaussian vector broadcast channel, dirty-paper coding, physically degraded relay channel, scalar Gaussian relay channel, Gaussian interference channel, cut-set bound, network coding, fading channels, multiuser water filling, block fading, diversity, user diversity, capacity versus outage, near-far gain, dual antenna arrays |
| 6  | <b>Lernziele und Kompetenzen</b>         | The students model any multiple access method as a special case of code-division multiple access.<br>The students apply various algorithms for multiuser detection.<br>The students explain various types of multiuser channels and their limits to transport information.<br>The students explain the limits of distributed source coding algorithms.<br>The students apply the cut-set bound.<br>The students explain the method of dirty-paper coding.<br>The students collaborate on solving exercise problems.                                                                                                                                                                                                                                                                                                                                                |
| 7  | <b>Voraussetzungen für die Teilnahme</b> | Recommended: A basic course on information theory (can be taken in parallel)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 8  | <b>Einpassung in Studienverlaufsplan</b> | Semester: 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 5 | <b>Inhalt</b>                            | Dual antenna arrays, compressive sensing, Wishart distribution, factor iid model, Kronecker model, convergence of random variables, semi-circle law, quarter circle law, full circle law, Haar distribution, Marchenko-Pastur distribution, Stieltjes transform, Girkos law, unitary invariance, freeness, free convolution, R-transform, free central limit theorem, free Poisson limit theorem, subordination, S-transform, R-diagonal random matrices, R-diagonal free convolution, Haagerup-Larsen law, operator-valued freeness, linearization of noncommutative polynomials, free Fourier transform, self-averaging properties, microscopic vs. macroscopic random variables, quenched random variable, a statistical physics point of view of digital systems, spin glasses, frozen disorder, replica method, replica continuity, replica symmetry, replica symmetry breaking, approximate message passing, classification of np-complete problems |
| 6 | <b>Lernziele und Kompetenzen</b>         | The students find the limiting eigenvalue distributions of various types of random matrices.<br>The students explain Stieltjes, R- and S-transforms.<br>The students explain the limits of various types of fading channels.<br>The students design coding and decoding methods for a given type of multiuser channel.<br>The students perform additive and multiplicative free convolution.<br>The students calculate the asymptotic eigenvalues distributions of given random matrix ensembles.<br>The students construct random matrix ensembles with a given eigenvalue distribution.<br>The students linearize matrix polynomials.<br>The students derive the Boltzmann distribution.<br>The students utilize saddle point integration.<br>The students perform replica calculations.<br>The students explain the meaning of replica symmetry breaking.<br>The students collaborate on solving exercise problems.                                    |
| 7 | <b>Voraussetzungen für die Teilnahme</b> | Recommended: Good skills in linear algebra, probability theory and complex analysis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 8 | <b>Einpassung in Studienverlaufsplan</b> | Semester: 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 5 | <b>Inhalt</b>                 | <p><b>*Description*</b></p> <p>In today's communications world, channel coding underlies the physical layer of all major communication systems. For example: algebraic block coding (Reed-Solomon codes) are used in the CD and DVD standards; trellis coded modulation is used in line modems; low-density parity check codes (LDPC) are used in satellite communications (DVB-S2 standard), LAN (10GBase-T Ethernet) and wireless LAN (Wi-Fi 802.11); turbo codes are implemented in 3G/4G mobile communications (e.g. in UMTS and LTE) and in (deep space) satellite communications. Recently, polar codes have been adopted for the eMBB (Enhanced Mobile Broadband) control channels for the 5G NR (5th Generation New Radio) interface.</p> <p>Objective of this course is to provide an introductory but thorough background on codes over graphs and covers both classical convolutional codes and the modern theory of random-like codes with iterative decoding. Namely, LDPCs (Low Density Parity Check Codes, Turbo Codes, and Polar Codes. Students will acquire the fundamental knowledge to design and analyze performance of channel codes on graphs, as well as implement the corresponding encoders and decoders.</p> <p><b>*Technical Content*</b></p> <ul style="list-style-type: none"> <li>• Role of channel coding in a communication system.</li> <li>• Idealized channel models : the binary symmetric channel (BSC), the binary erasure channel (BEC), the constrained-input Gaussian channel.</li> <li>• Some preliminary basic concepts from linear block codes: Parity Check, Hamming distance, weight enumerating functions, performance evaluations, and performance bounds.</li> <li>• Factor graphs and belief propagation.</li> <li>• Binary random-like codes: LDPC codes and message-passing decoding, threshold behaviour of message passing decoding: density evolution analysis. Design of LDPC ensembles.</li> <li>• Polar Codes: Polarization, polar channel coding, performance, encoding and decoding.</li> <li>• Binary convolutional codes : the algebraic structure, the dynamic structure, Viterbi decoding, performance analysis via weight enumerating function, the forward-backward algorithm.</li> <li>• Other random-like codes: the Turbo Codes. Efficient decoding of Turbo Codes via forward-backward algorithm and</li> </ul> |

|   |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 5 | <b>Inhalt</b>                 | <p>Telecommunications have become ubiquitous in daily life and wireless networks play a fundamental role thanks to their capability to support mobility. In a wireless communication, the concept of link does not exist. Users radiate energy and communicate through the superposition of each others transmissions which creates interference. Compared to wireline networks this scenario is extremely challenging but also offers unpredictable opportunities in the development of new technologies (massive MIMO, cognitive radio, etc.) and exploitation of new features, e.g., opportunistic communications and multiuser diversity. The exponentially increasing request of higher and higher throughput is satisfied densifying users and access points per unit area and allowing more and more interference while adopting advanced techniques and innovative resource allocation to mitigate the detrimental effects of interference.</p> <p>Objective of this course is to introduce the student to advanced techniques for coordinated medium access control and radio resource management in cellular systems. Power allocation, rate adaptation and scheduling will be discussed both in centralized and distributed settings. Some mathematical methods play a fundamental role in resource allocation, namely, classical Perron-Frobenius theory for nonnegative matrices, convex and nonconvex constrained optimization, distributed optimization and game theory. The course introduces the student to such methods and exemplifies their application to various resource allocation problems. Additionally, the course addresses relevant aspects of resource allocation in wireless networks such as fairness and cross-layer design.</p> <p><b>*Technical Content*</b></p> <ul style="list-style-type: none"> <li>• Properties and challenges of the wireless medium.</li> <li>• Basic concepts of communication networks: the layered architecture.</li> <li>• Evolution of wireless cellular network architectures: From Global System for Mobile to Advanced-Long Term Evolution.</li> <li>• Multiple Access Schemes: CSMA variants, TDMA, FDMA, CDMA, OFDMA, SC-FDMA, SDMA.</li> <li>• Uplink-downlink duality.</li> <li>• Opportunistic scheduling and multiuser diversity.</li> <li>• Advanced concepts: small cells and heterogeneous networks, relaying and cooperation, network coding, cognitive radio networks.</li> </ul> |

| 5  | <b>Inhalt</b>                            | Convex optimization problems are a special class of mathematical problems which arise in a variety of practical applications. In this course we focus on the theory of convex optimization, corresponding algorithms, and applications in communications and signal processing (e.g. statistical estimation, allocation of resources in communications networks, and filter design). Special attention is paid to recognizing and formulating convex optimization problems and their efficient solution. The course is based on the textbook "Convex Optimization" by Boyd and Vandenberghe and includes a tutorial in which many examples and exercises are discussed. |  |
| 6  | <b>Lernziele und Kompetenzen</b>         | Students <ul style="list-style-type: none"> <li>• characterize convex sets and functions,</li> <li>• recognize, describe and classify convex optimization problems,</li> <li>• determine the solution of convex optimization problems via the dual function and the KKT conditions,</li> <li>• apply numerical algorithms in order to solve convex optimization problems,</li> <li>• apply methods of convex optimization to different problems in communications and signal processing</li> </ul>                                                                                                                                                                      |  |

Prof. Dr. Wolfgang Gerstacker                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5 | <b>Inhalt</b>                    | <p>The aim of this lecture is that the students acquire a basic knowledge of advanced transmission and detection techniques which are relevant to practical mobile communications systems. In the first part, it is shown how equalization schemes like decision-feedback equalization (DFE) and maximum-likelihood sequence estimation (MLSE) can be applied to the GSM/EDGE (Enhanced Data Rates for GSM Evolution) standard. Also, channel estimation for GSM/EDGE is covered. In GSM/EDGE, disturbance by interfering signals of other users is a further major problem. Therefore, interference cancellation algorithms are discussed in detail. The cases of several receive antennas and one receive antenna (single antenna interference cancellation) are distinguished. Several receive antennas can be also utilized for increasing the robustness against fading, applying diversity combination techniques. In the case of the availability of several transmit antennas only, additional space-time coding has to be used for realization of diversity gains. These aspects are also discussed in depth. Furthermore, an introduction to code-division multiple access (CDMA) transmission is given and it is shown how CDMA is applied in the UMTS system. The lecture is concluded by an introduction to digital transmission in the Long Term Evolution (LTE) system.</p> |

Jürgen Teich                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| 5 | <b>Inhalt</b>                            | <p>Approximate Computing denotes a quite young research area that exploits the fact and capability of many applications and systems to tolerate imprecision and/or inexactness of computed results. Prominent areas of applications and novel techniques of computing approximate rather than exact results have brought up new implementations either at hardware and/or software levels for important emergent workloads such as searching, mining, image processing, and data retrieval.</p> <p>Although hardware technology is improving at a fast pace, energy and power are becoming more and more important constraints apart from exactly computing results in an acceptable amount of time. The main goals of approximate computing techniques are therefore to exploit the possible trade-off between power/energy consumption, accuracy, performance, and/or cost, e.g., utilized hardware resources.</p> <p>The purpose of the course approximate computing is to instruct students about the main ideas and concepts of approximate computing. This includes analyzing the trade-off between energy consumption, accuracy, run-time and hardware costs, concrete approximating techniques (e.g. approximate hardware synthesis, approximating algorithms) as well as theoretical background (determining the computational error and its complexity).</p> |  |

| 5 | <b>Inhalt</b>                    | Mobile communication plays a significant role in our daily life. Over the last three decades the mobile applications have been tremendously enhanced from voice only over mobile broadband to applications for the mobile internet. Currently, the next generation of cellular systems, the so-called 5th Generation (5G) is developed and first commercial 5G networks are expected to be deployed around mid of 2019. 5G will play an outstanding role for the Internet of Things and will redefine a wide range of industries by enabling new use cases. This lecture will provide the technical foundation of 4G (LTE) and 5G mobile communication systems with a focus on the radio access network and the PHY & MAC layer concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>The students</p> <ul style="list-style-type: none"> <li>• learn the technical history of mobile communications from 2nd (GSM), 3rd (UMTS), 4th (LTE) to the 5th (5G New Radio) Generation</li> <li>• understand the system and radio access network architecture of modern cellular communications systems and their enhancements towards 5G</li> <li>• compare the physical layer design of LTE and 5G New Radio</li> <li>• discuss how 5G networks are designed to address a wide range of diverse services and devices</li> <li>• analyze enhanced radio resource management concepts for use cases like cellular V2X (Vehicle-to-Everything) and NB-IoT (Narrowband Internet of Things)</li> </ul> <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• erfahren die technische Geschichte der Mobilkommunikation von der 2. (GSM), 3. (UMTS), 4. (LTE) bis zur 5. Generation (5G New Radio)</li> <li>• verstehen die System- und Funkzugangsnetzarchitektur moderner zellulärer Kommunikationssysteme und ihre Verbesserungen bei 5G</li> <li>• vergleichen das Design der physikalischen Übertragungsschicht von LTE und 5G New Radio</li> <li>• diskutieren, wie 5G-Netze für eine breite Palette unterschiedlicher Dienste und Geräte konzipiert sind</li> <li>• analysieren verbesserte Funkressourcenverwaltungskonzepte für Anwendungsfälle wie zelluläre V2X (Vehicle-to-Everything)</li> </ul> |

| 5  | <b>Inhalt</b>                            | <p>Many control problems are nonlinear by nature. Classical control methods are based on linear approximations or a linearization of these systems in the neighborhood of setpoints to be controlled. In contrast to linear control theory, this module focuses on advanced nonlinear methods for the analysis and control of nonlinear systems by exploiting structural properties. In summary, the course covers the following topics:</p> <ul style="list-style-type: none"> <li>• Examples of nonlinear physical systems and nonlinear phenomena</li> <li>• Introduction to computer algebra software</li> <li>• Analysis of nonlinear systems</li> <li>• Stability of nonlinear systems (Lyapunov stability)</li> <li>• Lyapunov-based control design (Backstepping)</li> <li>• Reachability/controllability and observability of nonlinear systems</li> <li>• Exact linearization via feedback</li> <li>• Differential flatness of nonlinear systems</li> <li>• Flatness-based feedforward and feedback control of nonlinear systems</li> </ul> |  |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>After successful completion of the module, students will be able to</p> <ul style="list-style-type: none"> <li>• describe and analyze nonlinear systems</li> <li>• determine the input/output behavior of nonlinear systems</li> <li>• design nonlinear state feedback controllers via exact input-output and input-state linearization</li> <li>• apply the concept of differential flatness for the feedforward feedback control of nonlinear systems</li> <li>• use computer algebra software for the analysis and control design of nonlinear systems</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |

| 4 | <b>Modulverantwortliche/r</b>            | Prof. Dr.-Ing. Knut Graichen                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5 | <b>Inhalt</b>                            | <p>Many problems in economy and industry require an optimal solution under consideration of specific criteria and constraints. From a mathematical point of view, this requires the numerical solution of a parametric optimization problem or a dynamic optimization problem. The latter formulation accounts for the dynamics of the underlying process and is particularly relevant in the context of optimal control and model predictive control (MPC).</p> <p>In summary, the course covers the following topics:</p> <ul style="list-style-type: none"> <li>• Introduction to and examples of static and dynamic optimization problems</li> <li>• Unconstrained numerical optimization (optimality conditions, numerical methods)</li> <li>• Constrained numerical optimization (linear/quadratic/nonlinear problems, optimality conditions, numerical methods)</li> <li>• Dynamical optimization / optimal control problems (calculus of variations, optimality conditions, PMP, numerical methods)</li> <li>• Nonlinear model predictive control (formulations, stability, real-time solution)</li> </ul> |
| 6 | <b>Lernziele und Kompetenzen</b>         | <p>After successful completion of the module, students will be able to</p> <ul style="list-style-type: none"> <li>• differentiate the problem classes of parametric and dynamic optimization</li> <li>• formulate and analyze practical optimization problems</li> <li>• derive and solve the optimality conditions for unconstrained and constrained optimization problems using state-of-the-art software tools</li> <li>• classify the different formulations and stability criteria for nonlinear model predictive control</li> <li>• design a model predictive controller for a given control task and analyze the performance and stability properties in closed loop</li> <li>• realize and implement a real-time MPC for highly dynamical nonlinear systems with sampling times in the (sub)millisecond range using modern state-of-the-art (N)MPC software</li> </ul>                                                                                                                                                                                                                                     |

| 5  | <b>Inhalt</b>                            | <p>The students will learn the basics in <i>deep learning</i>, including <b>classical neural network models</b> and recent architectures. The students will acquire knowledge on processing different types of data with deep neural networks. In the exercises, the students will implement some of the standard models for classification or regression tasks and acquire knowledge on machine learning applications.</p> <p>The lecture topics include:</p> <ul style="list-style-type: none"> <li>• Learning from data, machine learning and deep learning</li> <li>• Machine learning principles</li> <li>• Artificial neural networks</li> <li>• Convolutional neural networks</li> <li>• Back-propagation</li> <li>• Network optimization</li> <li>• Initialisation, regularisation</li> <li>• Deep network architectures</li> <li>• Generative models</li> <li>• Auto-encoders</li> <li>• Sequential models</li> <li>• Deep learning applications</li> </ul> |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>The students will learn:</p> <ul style="list-style-type: none"> <li>• Machine learning theory</li> <li>• Artificial neural networks</li> <li>• Deep neural networks</li> <li>• Modern architectures</li> <li>• Model and parameter learning</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 4 | <b>Modulverantwortliche/r</b>    | Prof. Dr.-Ing. Knut Graichen                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5 | <b>Inhalt</b>                    | <p>Das Modul vermittelt die Grundlagen zur Beschreibung und Untersuchung von linearen dynamischen Systemen mit mehreren Ein- und Ausgangsgrößen im Zustandsraum sowie den zustandsraumbasierten Regler- und Beobachterentwurf. Die Inhalte sind:</p> <ul style="list-style-type: none"> <li>• Motivation der Zustandsraumbetrachtung dynamischer Systeme in der Regelungstechnik</li> <li>• Zustandsraumdarstellung dynamischer Systeme und deren Vereinfachung durch Linearisierung</li> <li>• Analyse linearer und zeitinvarianter Systeme: Stabilität, Steuerbarkeit, Beobachtbarkeit, Zusammenhang mit Ein-/Ausgangsbetrachtung</li> <li>• Auslegung von linearen Zustandsreglern für lineare Eingrößensysteme</li> <li>• Erweiterte Regelkreisstrukturen, insbesondere Vorsteuerung und Störgrößenkompensation</li> <li>• Entwurf von Zustands- und Störgrößenbeobachtern und Kombination mit Zustandsreglern (Separationsprinzip)</li> </ul>                                                                                                                                                                                                      |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Die Studierenden können</p> <ul style="list-style-type: none"> <li>• die Vorzüge der Zustandsraumbetrachtung im Vergleich zur Ein-/Ausgangsbetrachtung darlegen.</li> <li>• für dynamische Systeme die Zustandsgleichungen aufstellen und durch Linearisierung vereinfachen.</li> <li>• für LZI-Systeme die Zustandsgleichungen in Normalformen transformieren.</li> <li>• Stabilität, Steuer- und Beobachtbarkeit von Zustandssystemen definieren und LZI-Systeme daraufhin untersuchen.</li> <li>• ausführen, wie diese Eigenschaften mit den Eigenwerten und Nullstellen von LZI-Zustandssystemen zusammenhängen.</li> <li>• den Aufbau einer Zwei-Freiheitsgrade-Zustandsregelung angeben und die Zweckbestimmung ihrer einzelnen Komponenten erläutern.</li> <li>• realisierbare Vorsteuerungen zur Einstellung des Sollverhaltens entwerfen.</li> <li>• Zielstellung und Aufbau eines Zustandsbeobachters erläutern.</li> <li>• diesen zu einem Störbeobachter erweitern und Störaufschaltungen zur Kompensation von Dauerstörungen konzipieren.</li> <li>• beobachterbasierte Zustandsregelungen durch Eigenwertvorgabe entwerfen.</li> </ul> |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Sebastian Schlecht                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 5 | <b>Inhalt</b>                    | <p>Der Kurs beinhaltet die grundlegenden Methoden der statistischen Signalverarbeitung und deren Anwendungen. The Hauptthemen sind:</p> <ul style="list-style-type: none"> <li>• Zeitdiskrete Zufallsprozesse im Zeit- und Frequenzbereich: Zufallsvariablen (ZVn), Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte; Transformation von ZVn; Vektoren normalverteilter ZVn; zeitdiskrete Zufallsprozesse (ZPe): Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte, Stationarität, Zyklstationarität, Ergodizität, Korrelationsfunktionen und -matrizen, Spektraldarstellungen; Principal Component Analysis, Karhunen-Loeve Transformation;</li> <li>• Schätztheorie: Schätzkriterien; Prädiktion; klassische und Bayessche Parameterschätzung (inkl. MMSE, Maximum Likelihood, Maximum A Posteriori); Cramer-Rao-Schranke</li> <li>• Lineare Signalmodelle: Parametrische Modelle (Cepstrale Zerlegung, Paley-Wiener Theorem, Spektrale Glattheit); Nichtparametrische Modelle: Allpole-/Allzero-/Pole-zero-(AR/MA/ARMA) Modelle; Lattice-Strukturen, Yule-Walker Gleichungen, PARCOR-Koeffizienten, Cepstraldarstellungen;</li> <li>• Signalschätzung: Überwachte Signalschätzung, Problemklassen; Orthogonalitätsprinzip, MMSE-Schätzung, lineare MMSE-Schätzung für Gaußprozesse; Optimale FIR-Filter; Lineare Optimalfilter für stationäre Prozesse; Prädiktion und Glättung; Kalman-Filter; optimale Multikanalfilterung (Wiener-Filter, LCMV, MVDR, GSC);</li> <li>• Adaptive Filterung: Gradientenverfahren; LMS-, NLMS-, APA- und RLS-Algorithmus und Ihr Konvergenzverhalten.</li> </ul> |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• analysieren die statistischen Eigenschaften von Zufallsvariablen, -vektoren und stochastischen Prozessen mittels Wahrscheinlichkeitsdichten und Erwartungswerten, bzw. Korrelationsfunktionen, Korrelationsmatrizen und deren Frequenzbereichsdarstellungen</li> <li>• kennen die spezielle Rolle der Gaußverteilung und ihre Auswirkungen auf die Eigenschaften von Zufallsvariablen, -vektoren und Prozessen</li> <li>• verstehen die Unterschiede klassischer und Bayesscher Schätzung, entwerfen und analysieren MMSE- und ML-</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                                                    |
|----|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                          | <p>Schätzer für spezielle Schätzprobleme, insbesondere zur Signalschätzung</p> <ul style="list-style-type: none"> <li>• analysieren und evaluieren lineare MMSE-optimale Schätzer (ein- und vielkanalige Wiener-Filter und Kalman-Filter) für direkte und inverse überwachte Schätzprobleme;</li> <li>• evaluieren adaptive Filter zur Identifikation optimaler linearer Signalschätzer</li> </ul> |
| 7  | <b>Voraussetzungen für die Teilnahme</b> | Module Signale und Systeme I und Signale und Systeme II, Digitale Signalverarbeitung oder gleichwertige stark empfohlen                                                                                                                                                                                                                                                                            |
| 8  | <b>Einpassung in Studienverlaufsplan</b> | Semester: 1                                                                                                                                                                                                                                                                                                                                                                                        |

| 5 | <b>Inhalt</b>                            | <p>This course is an introduction into machine learning and artificial intelligence. The special emphasis is on applications to modern signal processing problems. The course is focused on design principles of machine learning algorithms. The lectures start with a short introduction, where the nomenclature is defined. After this, probabilistic graphical models are introduced and the use of latent variables is discussed, concluding with a discussion of hidden Markov models and Markov fields. The second part of the course is about deep learning and covers the use of deep neural networks for machine learning tasks. In the last part of the lecture, the use of deep neural networks for speech processing tasks is introduced.</p> <p>The course is based on the materials and video footage from Dr. Roland Maas. He is an outstanding machine learning expert and a former member of the Chair of Multimedia Communications and Signal Processing.</p> |  |

Jörg Franke                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5 | <b>Inhalt</b>                    | <p>Das Modul Grundlagen der Robotik richtet sich insbesondere an die Studierenden der Informatik, des Maschinenbaus, der Mechatronik, der Medizintechnik sowie des Wirtschaftsingenieurwesens. Es werden zunächst die Grundlagen der modernen Robotik erläutert und anschließend fachspezifische Grundlagen zur Konzeption, Implementierung und Realisierung von Robotersystemen vermittelt. Hierbei liegt der Fokus neben klassischen Industrierobotern auch auf neuen Robotertechnologien für den Service-, Pflege- und Medizinbereich. Es werden weiterhin die Grundlagen des Robot Operating System (ROS) vermittelt und es wird durch praktische Übungen die Arbeit und Roboterprogrammierung mit ROS erlernt. Das Modul umfasst hierfür die nachfolgenden Themenschwerpunkte:</p> <ul style="list-style-type: none"> <li>• Bauformen, Begriffe, Definitionen, Historie, rechtliche Grundlagen und Roboterethik</li> <li>• Roboteranwendungen in Industrie, Service, Pflege und Medizin</li> <li>• Sensorik und Aktorik für Robotersysteme</li> <li>• Kinematik und Dynamik verschiedener Roboterbauformen</li> <li>• Steuerung, Regelung und Bahnplanung</li> <li>• Varianten der Roboterprogrammierung</li> <li>• Planung und Simulation von Robotersystemen</li> <li>• Robot Operating System (ROS)</li> <li>• Computer Vision (OpenCV)</li> </ul> |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Ziel ist, den Studierenden einen fundierten Überblick über aktuelle Roboterapplikationen zu vermitteln sowie die grundlegenden Bauformen, Begrifflichkeiten und gesetzlichen Rahmenbedingungen vorzustellen. Darauf aufbauen werden die notwendigen technischen Grundlagen moderner Robotersysteme sowie die Programmierung eines Roboters mit ROS erlernt.</p> <p>Die Studierenden sind in der Lage:</p> <ul style="list-style-type: none"> <li>• Roboter hinsichtlich ihrer Eigenschaften zu klassifizieren, das für eine vorgegebene Anwendung optimale Robotersystem auszuwählen und hierbei ethische und arbeitsschutzrechtliche Aspekte zu berücksichtigen.</li> <li>• Robotersysteme auszulegen, zu entwickeln und die erforderlichen Bewegungsabläufe zu planen,</li> <li>• die für verschiedene Roboterapplikationen notwendige Sensorik und Aktorik auszuwählen,</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|    |                                          |                                                                                                                                                                                                                                            |

| 6 | <b>Lernziele und Kompetenzen</b> | <p>In this module, students independently implement advanced tasks in robotics and related topics such as simulation, computer vision and machine learning using concrete examples. In doing so, the students deal with various established software frameworks and learn how to use them.</p> <p>Students are taught the following technical and methodological competences:</p> <p>After completing the module, students will be able to</p> <ul style="list-style-type: none"> <li>• Classify important terms of robotics</li> <li>• Understand the challenges of modern robotics in relation to complex tasks and develop approaches to solve them.</li> <li>• Analyse and practically apply complex issues in robotics (robotics frameworks, simulation tools and frameworks for image processing and artificial intelligence)</li> <li>• Explain and apply methods of robot motion control and planning</li> <li>• Explain the self-localisation of mobile robots and examine it using examples</li> </ul> <p>The students additionally acquire and train the following personal and social competences within the framework of the team task:</p> <p>After completing the module, the students can</p> <ul style="list-style-type: none"> <li>• Independently solve preparatory tasks</li> <li>• Organize their working time</li> <li>• Work together with other students in a group in a goal-oriented manner</li> <li>• Assess their own strengths and use them in a targeted way in the team performance</li> </ul> |

Tobias Distler                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5 | <b>Inhalt</b>                 | <p>Verteilte Systeme bestehen aus mehreren Rechnern, die über ein Netzwerk miteinander verbunden sind und einen gemeinsamen Dienst erbringen. Obwohl die beteiligten Rechner hierfür in weiten Teilen unabhängig voneinander agieren, erscheinen sie ihren Nutzern gegenüber in der Gesamtheit dabei trotzdem als ein einheitliches System. Die Einsatzmöglichkeiten für verteilte Systeme erstrecken sich über ein weites Spektrum an Szenarien: Von der Zusammenschaltung kleinster Rechenknoten zur Sammlung von Daten im Rahmen von Sensornetzwerken über Steuerungssysteme für Kraftfahrzeuge und Industrieanlagen bis hin zu weltumspannenden, Internet-gestützten Infrastrukturen mit Komponenten in Datenzentren auf verschiedenen Kontinenten.</p> <p>Ziel dieses Moduls ist es, die sich durch die speziellen Eigenschaften verteilter Systeme ergebenden Problemstellungen zu verdeutlichen und Ansätze zu vermitteln, mit deren Hilfe sie gelöst werden können; Beispiele hierfür sind etwa die Interaktion zwischen heterogenen Systemkomponenten, der Umgang mit erhöhten Netzwerklatenzen sowie die Wahrung konsistenter Zustände über Rechengrenzen hinweg. Gleichzeitig zeigt das Modul auf, dass die Verteiltheit eines Systems nicht nur Herausforderungen mit sich bringt, sondern auf der anderen Seite auch Chancen eröffnet. Dies gilt insbesondere in Bezug auf die im Vergleich zu nicht verteilten Systemen erzielbare höhere Widerstandsfähigkeit eines Gesamtsystems gegenüber Fehlern wie den Ausfällen ganzer Rechner oder sogar kompletter Datenzentren.</p> <p>Ausgehend von den einfachsten, aus nur einem Client und einem Server bestehenden verteilten Systemen, beschäftigt sich die Vorlesung danach mit der deutlich komplexeren Replikation der Server-Seite und behandelt anschließend die Verteilung eines Systems über mehrere, mitunter weit voneinander entfernte geografische Standorte. In allen Abschnitten umfasst die Betrachtung des jeweiligen Themas eine Auswahl aus Grundlagen, im Praxiseinsatz befindlicher Ansätze und Techniken sowie für den aktuellen Stand der Forschung repräsentativer Konzepte.</p> <p>Im Rahmen der Übungen wird zunächst ein plattformunabhängiges Fernaufrufsystem schrittweise entwickelt und parallel dazu getestet. Als Vorlage und Orientierungshilfe dient dabei das in der Praxis weit verbreitete Java RMI. In den weiteren Übungsaufgaben stehen</p> |

| 5 | <b>Inhalt</b>                    | <p>The students will learn advanced deep learning topics, including recent network architectures, generative models, self-supervision, interpretability and explainability. In the exercises, the students will implement advanced models and techniques for classification or regression tasks.</p> <p>The lecture topics include:</p> <ul style="list-style-type: none"> <li>• Geometric deep learning</li> <li>• Attention and transformers</li> <li>• Unsupervised and self-supervised learning</li> <li>• Generative models</li> <li>• Interpretability</li> <li>• Explainability</li> <li>• Efficient Inference</li> <li>• Uncertainty estimation</li> <li>• Transfer learning and domain adaptation</li> <li>• Few-shot learning</li> </ul> <p>Die Studierenden lernen erweiterte Themen des Deep Learning kennen, darunter aktuelle Netzwerkarchitekturen, generative Modelle, Selbst-Überwachung, Interpretierbarkeit und Erklärbarkeit. In den Übungen werden die Studierenden fortgeschrittene Modelle und Techniken für Klassifizierungs- oder Regressionsaufgaben implementieren.</p> <p>Zu den Vorlesungsthemen gehören:</p> <ul style="list-style-type: none"> <li>• Geometric deep learning</li> <li>• Attention and transformers</li> <li>• Unsupervised and self-supervised learning</li> <li>• Generative models</li> <li>• Interpretability</li> <li>• Explainability</li> <li>• Efficient Inference</li> <li>• Uncertainty estimation</li> <li>• Transfer learning and domain adaptation</li> <li>• Few-shot learning</li> </ul> |

| 5  | <b>Inhalt</b>                            | Legged robotics help researchers understand human and animal locomotion. Furthermore, legged robots have many different applications, for example to aid in dangerous environments and in rehabilitation. Active prosthetics and exoskeletons improve gait of people with a disability, like a spinal cord injury or an amputation. The goal of this seminar is to become familiar with different algorithms and analysis methods that are used for legged robotics. Important concepts here are the energetics and the stability. Robots should be energy efficient, in the case of an exoskeleton to not lose battery power for a day. Obviously, stability is important to avoid falls. Each student will perform a literature review of a specific concept related to robot locomotion. The concepts can be chosen from a list, or the student can propose their own topic. Students can choose to perform an extra assignment to receive an additional 2.5 ECTS. The assignment will require the student to implement the chosen concept in simulation or in practice. |  |

| 5  | <b>Inhalt</b>                            | <p>The aim of this lecture is to teach methods of gait analysis and simulation. Gait analysis experiments will be covered, as well as more modern approaches to gather walking data. Techniques to process gait analysis experiments are discussed, as well as dynamic models that can be used to create gait simulations. This lecture addresses the following topics:</p> <ul style="list-style-type: none"> <li>• Measurement systems for gait analysis</li> <li>• Methods to calculate joint kinetics and kinematics from experimental data</li> <li>• Muscle biology, specific to force generation, and modelling of muscles</li> <li>• Methods to calculate muscle activation from experimental data</li> <li>• Energetics of walking</li> <li>• Multibody dynamics</li> <li>• Creating simulations of gait</li> </ul> |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>Learning objectives:</p> <ul style="list-style-type: none"> <li>• Be familiar with the existing measurement options for gait analysis</li> <li>• Know state-of-the art techniques to process gait analysis experiments</li> <li>• Select an appropriate processing technique for a specific experiment</li> <li>• Understand how gait could be simulated and where these simulations could be applied</li> <li>• Know the function of the different components of the human body that are involved in locomotion</li> </ul>                                                                                                                                                                                                                                                                                               |
| 7  | <b>Voraussetzungen für die Teilnahme</b> | Keine                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 5 | <b>Inhalt</b>                    | <p>The aim of this course is to teach methods of gait analysis and simulation. The lectures start with an introduction to relevant anatomic terms and definitions, followed by an introduction to the motions performed when walking or running. Different sensors and laboratory equipment are introduced, which are used to record gait/human movement. We will discuss different processing methods that can be used to determine relevant kinetic and kinematic parameters related to gait, such as joint angles, joint moments, and muscle forces. The second half of the lectures will focus on gait simulations. First, we discuss simulation methods, dynamic models and optimization techniques used to create gait simulations. Second, neural control of gait is discussed, as well as how simulations can be created to investigate this neural control. This lecture addresses the following topics:</p> <ul style="list-style-type: none"> <li>• Measurement systems for gait analysis</li> <li>• Methods to calculate joint kinetics and kinematics from experimental data</li> <li>• Muscle biology specific to force generation, and modelling of muscles</li> <li>• Methods to calculate muscle activation and force from experimental data</li> <li>• Energetics of walking</li> <li>• Multibody dynamics</li> <li>• Trajectory optimization for gait simulations</li> </ul> <p>Gait simulations based on neural control models</p> |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Knowledge:</p> <ul style="list-style-type: none"> <li>• The students learn what a normal walking and running gait cycle looks like</li> <li>• The students learn about the human body and commonly used anatomical and engineering terms that are important to describe locomotion.</li> <li>• The students learn about commonly used measurement and processing techniques to measure and calculate biomechanical parameters related to gait</li> <li>• The students learn how human gait simulations can be created.</li> <li>• The students learn about the control of human gait.</li> </ul> <p>Understanding:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 4  | <b>Modulverantwortliche/r</b>            | Prof. Dr.-Ing. Martin Vossiek                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5  | <b>Inhalt</b>                            | <p>Radar, RFID and wireless sensor and wireless locating systems are essential for automotive advanced driver-assistance systems (ADAS), autonomous driving and flying, robotics, industrial automation, logistics and novel human machine interfaces. Further key areas include medical electronics, building technology and cyber-physical systems.</p> <p>The module "Radar, RFID and Wireless Sensors" is an introduction into functional principles, building blocks, hardware and signal processing concepts and applications of modern radar, RFID, wireless sensor and real time locating systems. Covered applications include automotive radar, road and air traffic control systems, as well as robotics, industrial automation and medical technology.</p> <p>RWS is an identical replacement of the former module "Drahtlose Sensoren, Radar- und RFID-Systeme DSR.</p> |
| 6  | <b>Lernziele und Kompetenzen</b>         | <p>The students</p> <ul style="list-style-type: none"> <li>• learn about the setup, function and application of wireless sensors, Radar and RFID-systems</li> <li>• can analyze, discuss and implement basic components and system structures, signal theory, data processing and use cases</li> <li>• can determine the underlying physical limitations and sources of errors</li> <li>• are able to analyze and create system specifications and can compare and rate the usability of wireless esnsors, Radar and RFID-systems</li> <li>• can create and define independently applications and system designs of RWSs</li> </ul>                                                                                                                                                                                                                                                  |

| 4 | <b>Modulverantwortliche/r</b>    | Prof. Dr.-Ing. Sebastian Schlecht                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 5 | <b>Inhalt</b>                    | <p>Der Kurs beinhaltet die grundlegenden Methoden der statistischen Signalverarbeitung und deren Anwendungen. The Hauptthemen sind:</p> <ul style="list-style-type: none"> <li>• Zeitdiskrete Zufallsprozesse im Zeit- und Frequenzbereich: Zufallsvariablen (ZVn), Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte; Transformation von ZVn; Vektoren normalverteilter ZVn; zeitdiskrete Zufallsprozesse (ZPe): Wahrscheinlichkeitsverteilungen und dichten, Erwartungswerte, Stationarität, Zyklstationarität, Ergodizität, Korrelationsfunktionen und -matrizen, Spektraldarstellungen; Principal Component Analysis, Karhunen-Loeve Transformation;</li> <li>• Schätztheorie: Schätzkriterien; Prädiktion; klassische und Bayessche Parameterschätzung (inkl. MMSE, Maximum Likelihood, Maximum A Posteriori); Cramer-Rao-Schranke</li> <li>• Lineare Signalmodelle: Parametrische Modelle (Cepstrale Zerlegung, Paley-Wiener Theorem, Spektrale Glattheit); Nichtparametrische Modelle: Allpole-/Allzero-/Pole-zero-(AR/MA/ARMA) Modelle; Lattice-Strukturen, Yule-Walker Gleichungen, PARCOR-Koeffizienten, Cepstraldarstellungen;</li> <li>• Signalschätzung: Überwachte Signalschätzung, Problemklassen; Orthogonalitätsprinzip, MMSE-Schätzung, lineare MMSE-Schätzung für Gaußprozesse; Optimale FIR-Filter; Lineare Optimalfilter für stationäre Prozesse; Prädiktion und Glättung; Kalman-Filter; optimale Multikanalfilterung (Wiener-Filter, LCMV, MVDR, GSC);</li> <li>• Adaptive Filterung: Gradientenverfahren; LMS-, NLMS-, APA- und RLS-Algorithmus und Ihr Konvergenzverhalten.</li> </ul> |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• analysieren die statistischen Eigenschaften von Zufallsvariablen, -vektoren und stochastischen Prozessen mittels Wahrscheinlichkeitsdichten und Erwartungswerten, bzw. Korrelationsfunktionen, Korrelationsmatrizen und deren Frequenzbereichsdarstellungen</li> <li>• kennen die spezielle Rolle der Gaußverteilung und ihre Auswirkungen auf die Eigenschaften von Zufallsvariablen, -vektoren und Prozessen</li> <li>• verstehen die Unterschiede klassischer und Bayesscher Schätzung, entwerfen und analysieren MMSE- und ML-</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                                                    |

| 5 | <b>Inhalt</b>                            | <p>This course is an introduction into machine learning and artificial intelligence. The special emphasis is on applications to modern signal processing problems. The course is focused on design principles of machine learning algorithms. The lectures start with a short introduction, where the nomenclature is defined. After this, probabilistic graphical models are introduced and the use of latent variables is discussed, concluding with a discussion of hidden Markov models and Markov fields. The second part of the course is about deep learning and covers the use of deep neural networks for machine learning tasks. In the last part of the lecture, the use of deep neural networks for speech processing tasks is introduced.</p> <p>The course is based on the materials and video footage from Dr. Roland Maas. He is an outstanding machine learning expert and a former member of the Chair of Multimedia Communications and Signal Processing.</p> |  |

| 5 | <b>Inhalt</b>                            | How do humans perceive the visual world? How can we build computational models to mimic this human perception? And how can we validate those computational models? This course is designed as an introduction to enable you to build computational models for human visual perception. It will therefore provide an introduction into the human visual system building on the course on cognitive neuroscience for AI developers. You will learn how the human eye and brain process visual input and what we currently know about the ventral visual stream. We will look at computational models for all different levels of visual processing and discuss how well they measure behavioral data. This lecture is designed to be at the intersection of Computer Science (Computer Vision and Graphics) and Cognitive Neuroscience. After an initial introductory phase, you will in small teams (1-3 students) perform a project to build prototypes for computational models for visual processing, reproduce recent scientific results or experiment with existing models.<br>In addition to the project phase we will read and discuss recent research papers studying potential computational models and investigate how we can evaluate computational models.<br>Please sign up via studon |  |
| 6 | <b>Lernziele und Kompetenzen</b>         | By the end of this course, students will be able to <ul style="list-style-type: none"> <li>• Describe the basic processing steps of visual input in the human brain</li> <li>• Build a computational model for a known processing step</li> <li>• Read recent papers in the discipline and design a follow-up experiment</li> <li>• Choose/design and conduct a small research project</li> <li>• Choose adequate methods to evaluate a computational model</li> <li>• Work in and manage projects</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |

| 5 | <b>Inhalt</b>                 | <p>Radar is a key technology for a growing number of sensing tasks that range from the detection, location and tracking of moving objects to high-resolution imaging of surfaces, sub-surfaces and 3-D volumes. While the traditional radar applications focused on aerospace security, weather services and traffic surveillance, radar is now becoming a central contactless sensor technology for the automotive sector, medical diagnostics, gesture control, civil engineering, as well as large scale environmental and climate change monitoring, to name only a few. Associated with the new applications is an increasing demand for advanced signal processing techniques to extract the relevant information from the microwave echoes acquired by single- and multi-aperture radar systems in complex environments. This lecture will give an overview of a variety of one-, two-, and three-dimensional radar signal and image processing algorithms and their application for different sensing tasks. The theoretical derivations are complemented by computer examples and simulations that form an integral part of both the lecture and the exercises.</p> <p>The lecture covers the following topics:</p> <ul style="list-style-type: none"> <li>• Introduction (radar principles &amp; applications, signal &amp; noise models, interference, Doppler shift)</li> <li>• Basics of Signal Processing with Python (Jupyter Notebooks)</li> <li>• Data Acquisition (I/Q demodulation, complex signal representation, sampling, quantization)</li> <li>• Range Processing (radar waveforms, pulse compression, ambiguity function, sidelobe reduction)</li> <li>• Doppler Processing (MTI, clutter suppression, range-Doppler ambiguities, spectral estimation)</li> <li>• Detection Theory (target models, Neyman-Pearson criterion, CFAR detector, CRBs)</li> <li>• Multi-Channel Processing (spatial filtering, interference suppression, adaptive beamforming)</li> <li>• Synthetic Aperture Radar (basics of coherent imaging, SAR data model, time-domain processing)</li> <li>• SAR Focusing Algorithms (range-Doppler, chirp scaling, motion compensation, autofocus)</li> <li>• SAR Image Analysis (image statistics, speckle filtering, segmentation, classification)</li> <li>• Radar Polarimetry (wave representations, scattering models, polarimetric decomposition)</li> <li>• Interferometry (interferometric processing chain, statistical performance models, applications)</li> </ul> |

|   |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 5 | <b>Inhalt</b>                    | <p>The students will learn robotic perception topics, including camera models, filtering, transformations, low-level features, point-cloud processing, recognition, pose estimation, localization, mapping, depth, and motion estimation. In the exercises, the students will implement techniques for different perception modules.</p> <p>The lecture topics include:</p> <ul style="list-style-type: none"> <li>• Sensor models</li> <li>• Camera calibration</li> <li>• Feature detection and matching.</li> <li>• Edges, lines, circles.</li> <li>• Transformations.</li> <li>• Multiple views.</li> <li>• Recognition.</li> <li>• Pose estimation.</li> <li>• Localization and mapping.</li> <li>• Depth estimation.</li> <li>• Point-cloud processing.</li> </ul> <p><i>Die Studierenden lernen Themen der Roboterwahrnehmung kennen, darunter Kameramodelle, Filterung, Transformationen, Low-Level-Merkmale, Punktwolkenverarbeitung, Erkennung, Posenschätzung, Lokalisierung, Mapping, Tiefen- und Bewegungsschätzung. In den Übungen werden die Studierenden Methoden für verschiedene Wahrnehmungsmodule implementieren.</i></p> <p><i>Zu den Vorlesungsthemen gehören:</i></p> <ul style="list-style-type: none"> <li>• Sensor Modelle</li> <li>• Kamerakalibrierung</li> <li>• Merkmalerkennung und -abgleich.</li> <li>• Kanten, Linien, Kreise.</li> <li>• Transformationen.</li> <li>• Mehrere Views.</li> <li>• Erkennung.</li> <li>• Schätzung der Pose.</li> <li>• Lokalisierung und Mapping.</li> <li>• Schätzung der Tiefe.</li> <li>• Punktwolken-Verarbeitung.</li> </ul> |

Jürgen Seiler                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5 | <b>Inhalt</b>                    | <p>Das Modul "Transformationen in der Signalverarbeitung" behandelt mehrere verschiedene Transformationen, die im Rahmen der Signalverarbeitung Verwendung finden. Dabei werden zuerst die grundlegenden Konzepte von Transformationen diskutiert und die Vorteile die Transformationen mit sich bringen erläutert. Im Anschluss daran werden die grundlegenden Eigenschaften von Integraltransformationen betrachtet und die Laplace- und die Fourier-Transformation im Detail untersucht. Um auch zeitlich veränderliche Signale gut transformieren zu können werden danach die Kurzzeit-Fourier-Transformation und die Gabor-Transformation eingeführt. Im Anschluss daran erfolgt eine Betrachtung der Auswirkung der Abtastung auf transformierte Signale, bevor die z-Transformation als Transformation für diskrete Signale behandelt wird. Abschließend erfolgt die Betrachtung weiterer Transformationen für diskrete Signale wie der Diskreten Fourier-Transformation oder linearer Block-Transformationen. The module "Transforms in Signal Processing" covers several different transforms which are used in the field of signal processing. For this, first the basic concepts of transforms are discussed and the advantages which are offered by the different transforms are presented. Subsequent to this, fundamental properties of integral transforms are considered and the Laplace- and the Fourier-Transform are examined in detail. To be able to transform time-varying signals, the Short-Time Fourier-Transform and the Gabor-Transform are introduced, afterwards. Subsequent to this, the impact of sampling on transformed signals is analyzed before the z-Transform as a transform for discrete signals is covered. Finally, further transforms for discrete signals like the Discrete Fourier-Transform or Linear-Block Transforms are discussed.</p> |

| 5 | <b>Inhalt</b>                    | This lecture discusses important algorithms from the field of computer vision. The emphasis lies on 3-D vision algorithms, covering the geometric foundations of computer vision, and central algorithms such as stereo vision, structure from motion, optical flow, and 3-D multiview reconstruction. Participants of this advanced course are expected to bring experience from prior lectures either from the field of pattern recognition or from the field of computer graphics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6 | <b>Lernziele und Kompetenzen</b> | <p>Die Vorlesung stellt eine Auswahl von Methoden aus dem Gebiet der Computer Vision vor, die in dem Feld eine zentrale Stellung einnehmen. In den Übungen implementieren und evaluieren die Studierenden selbständig diese Methoden. Die Studierenden arbeiten die ganze Zeit über an populären Computer Vision-Methoden wie zum Beispiel Stereosehen, optischer Fluss und 3D-Rekonstruktion aus mehreren Ansichten. Für diese Probleme</p> <ul style="list-style-type: none"> <li>• beschreiben die Studierenden perspektivische Projektion, Rotationen und verwandte geometrische Grundlagen,</li> <li>• erklären die Studierenden die behandelten Methoden,</li> <li>• diskutieren die Studierenden Vor- und Nachteile verschiedener Modalitäten zur Erfassung von 3D-Informationen,</li> <li>• implementieren die Studierenden einzeln und gemeinschaftlich in Kleingruppen Code,</li> <li>• entdecken die Studierenden optimale Vorgehensweisen in der Datenaufnahme,</li> <li>• erkunden und bewerten die Studierenden unterschiedliche Möglichkeiten für die Evaluation,</li> <li>• diskutieren und präsentieren die Gruppenarbeiter in Gruppen die Vor- und Nachteile ihrer Implementierungen,</li> <li>• diskutieren und reflektieren die Studierenden gesellschaftliche Auswirkungen von Anwendungen des 3D-Rechnersehens.</li> </ul> <p>The lecture introduces computer vision algorithms that are central to the field. In the exercises, participants autonomously implement and evaluate these algorithms. The participants work throughout the time on popular computer vision algorithms, like for example stereo vision, optical flow, and 3-D multiview reconstruction. For these problems, the participants</p> <ul style="list-style-type: none"> <li>• describe perspective projection, rotations, and related geometric foundations,</li> <li>• explain the presented methods,</li> </ul> |

Bernhard Schmauß                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5  | <b>Inhalt</b>                            | Optical data transmission systems are the enabler for our modern communication networks. Since the first systems have been installed, the transmission capacity as well as the transmission distance has been increased dramatically. The migration from point-to-point transmission systems to complex optical networks is still in progress. The fast evolution of optical transmission technology is stimulated by innovations in the field of the system key components. The lectures concentrate on the physical effects and properties of key components like semiconductor lasers, optical modulators, optical fibers, optical amplifiers and detector diodes. Especially also the nonlinear effects of the transmission fiber are discussed. The main focus is on the effects and characteristics which are important to achieve a certain system performance. The influence of component parameters on system performance is presented in examples related to installed systems and systems that are actually in development. The exercises partly use a numerical simulation tool to analyze the component influence on system performance. |

| 5  | <b>Contents</b>                       | <p>Six experiments are completed in the HRI (Human Robot Interaction) practical course. After an introduction to ROS and Python, three experiments are carried out with a Franka-Emika lightweight robot and two experiments with a humanoid NAO robot. The structure of each experiment is composed of a preparation phase, an execution phase and a reflection phase, in which the participants work in groups on tasks to create a complex application on each of the platforms.</p> <ul style="list-style-type: none"> <li>• Introduction to the Robot Operating System (ROS)</li> <li>• Introduction to Python</li> <li>• Teleoperation of the lightweight robot</li> <li>• Collaboration with the lightweight robot</li> <li>• Collision detection and reconfiguration with the lightweight robot</li> <li>• Object recognition with the humanoid robot as platform</li> <li>• Object recognition with neural networks</li> </ul> |
| 6  | <b>Learning objectives and skills</b> | Upon completion of the lab course, students will be able to understand the basic concepts of ROS and design applications of a lightweight robot in terms of human-machine interaction. They will learn how humanoid robots work and assess their current state of the art.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 5  | <b>Contents</b>                          | In the seminar, students will analyze, present. and discuss recent research topics in autonomous systems and mechatronics. This will comprise mechatronic component, system, and control design as well as advanced methods aiming at autonomous operation. Besides reflecting contemporary literature, the students are asked to conclude and suggest directions for future research. |
| 6  | <b>Learning objectives and skills</b>    | On successful completion of this module, students will be able to comprehend and convey recent research challenges in the area of autonomous system and mechatronics. Moreover, they are prepared to infer future research lines from recent developments.                                                                                                                             |

| 5  | <b>Contents</b>                          | In the seminar, students will analyze, present, and discuss recent research topics in human-robot-interaction. This will comprise aspects of cognitive and physical human-robot interaction and related topics of human and engineering sciences. Besides reflecting contemporary literature, the students are asked to conclude and suggest directions for future research. |
| 6  | <b>Learning objectives and skills</b>    | On successful completion of this module, students will be able to comprehend and convey recent research challenges in the area of human-robot interaction. Moreover, they are prepared to infer future research lines from recent developments.                                                                                                                              |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4  | <b>Module coordinator</b>                | Prof. Dr. Anne Koelewijn                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5  | <b>Contents</b>                          | In this module, students will analyse, present and discuss issues and topics concerning the usage of biological signals in rehabilitation and assistive robotics, including the correct placement and use of the associated sensors, the techniques to condition the signals, sensor fusion, feature extraction and the usage of machine learning applied to such kind of signals.<br>Besides reflecting on contemporary literature, the students are asked to draw own conclusions and suggest directions for future research. |
| 6  | <b>Learning objectives and skills</b>    | On successful completion of the module, students will be familiar with sensors and signals used in rehabilitation and assistive robotics, both theoretically and practically. They will also be able to deduce potential new research lines from recent developments.                                                                                                                                                                                                                                                           |
| 7  | <b>Prerequisites</b>                     | Recommended: basic maths, especially statistics; fundamentals of signal processing and machine learning.                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 10 | <b>Method of examination</b>          | Practical achievement<br>The lab course comprises ten sessions of four hours plus two sessions of two hours, which include 7 work packages, a subjective test, and a final presentation. Each work package requires a preparation in written form and will be checked and reviewed (pass/fail) before the start of each session. During each of the ten mandatory lab sessions, the students are required to work on programming tasks, which will be reviewed at the end of each session (pass/fail). After these ten programming sessions, a working video codec has to be handed in. Besides, the students have to participate a subjective test, where the codec results are evaluated. In the last session, each video codec has to be presented by the students. A certificate confirming the successful participation in the laboratory is received if all work packages have been sufficiently prepared and implemented, if the results of all work packages have been combined into a functional and |

| 4  | <b>Module coordinator</b>                | Dr.-Ing. Heinrich Löllmann                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5  | <b>Contents</b>                          | <p>In this laboratory course the theory from the lecture Digital Signal Processing is applied in practice, using the programming environment MATLAB. The topics include quantization, spectral analysis, FIR and IIR filter design, filter banks and adaptive filters. The course consists of 5 guided experiments in which students work on programming problems in groups of two, and a 5-day block course where each group works on an individual project from the field of digital signal processing.</p> <p>The preparation, as well as the results of the past experiment will be examined by a short test at the beginning of each experiment. For passing the lab course, a minimum number of points from the tests and the project is required.</p> <p>The course requires previous experience in MATLAB programming. It is possible to take the course in parallel to the DSP lecture, however, revision of the relevant lecture contents before each lab lesson, and participation in the DSP exercises and tutorials is required.</p> |
| 6  | <b>Learning objectives and skills</b>    | <p>The students</p> <ul style="list-style-type: none"> <li>• create MATLAB programs for the each experiments and, by this, apply knowledge acquired in the DSP lecture and supplement course</li> <li>• analyze and evaluate the implemented algorithms</li> <li>• understand the requirements for practical realizations of algorithms for digital signal processing</li> <li>• reflect the learning progress during the lab course.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 4  | <b>Module coordinator</b>             | Prof. Dr. Vasileios Belagiannis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5  | <b>Contents</b>                       | The Seminar on Selected Topics of Multimedia Communications and Signal Processing deals with current research topics in the area of multimedia communications and signal processing. In an introductory meeting, the course of the seminar is outlined and each participant selects one of the offered topics. The participant should become familiar with the assigned research topic and present it by a report and a talk at the end of the seminar with the support of a supervisor. In an intermediate meeting about 5 weeks after the introductory meeting, the participants give a brief presentation about their topics and show first results. In addition, hints for the preparation of the final talk are provided at this meeting. At the end of the semester, a final one-day meeting takes place where each participant presents his topic in a talk of 30 minutes followed by a discussion and questions from the audience. In addition, each participant has to submit a report of about 10 pages about his topic a few days before the final meeting. |

| 5  | <b>Contents</b>                       | <p>Radio sensing as an integrated capability of mobile communication networks have been identified as one of the key features of future 6G cellular systems. The main challenge here lies in the joint design of sensing and communications because mobile communications and radar, for example, are still designed as more or less independent technologies and systems with different design approaches. But, especially, the convergence of both technologies is of utmost interest, enabling benefits of integrated radio sensing like</p> <ul style="list-style-type: none"> <li>• sensing/radar-as-a-service, e.g., for object and obstacle detection,</li> <li>• joint signal processing frameworks for both target/environment detection/analysis and wireless communications,</li> <li>• highly synchronous operation of both technologies,</li> <li>• balancing dual-functional performance (coordination gain),</li> <li>• performing mutual assistance,</li> <li>• increasing resource efficiency using shared radio resources,</li> <li>• jamming detection and mitigation,</li> <li>• optimization of the network performance based on collected sensing information.</li> </ul> |
| 6  | <b>Learning objectives and skills</b> | <p>The design of JC&amp;S-based wireless systems faces challenges in several electrical engineering areas, especially electronics design, radio-frequency (RF) design, information and communications technology (ICT) design, and system design. The seminar will examine the latest approaches, developments, and findings from research in the field of JC&amp;S and Integrated Sensing and Communication (ISAC), respectively. And topics are offered across all of the aforementioned disciplines. Participants in this seminar are expected to have a basic knowledge of communications systems, such as those acquired in the Digital Communications and Fundamentals of Mobile Communications lectures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 4  | <b>Module coordinator</b>             | Prof. Dr.-Ing. Walter Kellermann                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5  | <b>Contents</b>                       | <p>In this laboratory course the theory from the lecture Digital Signal Processing is applied in practice, using the programming environment MATLAB. The topics include quantization, spectral analysis, FIR and IIR filter design, filter banks and adaptive filters.</p> <p>The course consists of 5 guided experiments in which students work on programming problems in groups of two, and a 5-day block course where each group works on an individual project from the field of digital signal processing.</p> <p>The preparation, as well as the results of the past experiment will be examined by a short test at the beginning of each experiment. For passing the lab course, a minimum number of points from the tests and the project is required.</p> <p>The course requires previous experience in Python programming. It is possible to take the course in parallel to the DSP lecture, however, revision of the relevant lecture contents before each lab lesson, and participation in the DSP exercises is strongly recommended.</p> |
| 6  | <b>Learning objectives and skills</b> | <p>The students</p> <ul style="list-style-type: none"> <li>• create functional Python programs for the individual pre-drawn experiments and apply the knowledge acquired in the lecture and exercise</li> <li>• analyze and evaluate the algorithm they have implemented</li> <li>• understand the requirements of practical implementations of digital signal processing algorithms</li> <li>• reflect on their own learning process during the lab course.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 6 | <b>Learning objectives and skills</b> | <p>Die Studierenden vertiefen und erweitern ihre Kenntnisse der digitalen Nachrichtenübertragungsverfahren und der zugehörigen mathematischen Grundlagen anhand von Laborversuchen. Sie analysieren die Eigenschaften digitaler Pulsamplitudenmodulation und Varianten digitaler PAM. Dazu erzeugen sie im Labor mit der zur Verfügung gestellten Ausrüstung Sendesignale, die sie mit Hilfe üblicher Messgeräte (Oszilloskop, Effektivwertmesser) analysieren. Sie bauen Übertragungsstrecken für diese PAM-Verfahren auf und untersuchen die Effekte auf Empfängerseite. Sie bestimmen Störabstände, Fehlerraten usw.</p> <p>Des weiteren setzen die Studierenden ihre Kenntnisse der PAM-Übertragungsverfahren in selbst erstellte MATLAB-Routinen um, die die Simulation einer kompletten PAM-Übertragung mit Sender, Kanal</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

und Empfänger am Rechner modellieren. In einem weiteren Versuch ergänzen die Studierenden dieses Modell um eine OFDM-Übertragung und analysieren die Funktionsweisen von OFDM-Sendern und -empfängern. Sie untersuchen die Arbeitsweise von Ladealgorithmen bei OFDM-Systemen und implementieren diese in MATLAB.

Die Studierenden verdeutlichen sich das Konzept der Signalraumdarstellung in der digitalen Übertragung und implementieren ein beispielhaftes System in MATLAB. Sie erstellen Routinen zur Gram-Schmidt-Orthogonalisierung und zur FSK-Übertragung in MATLAB.

Die Studierenden analysieren einfache MIMO-Szenarien und implementieren entsprechende Empfängeralgorithmen.

Die Studierenden bereiten die Bearbeitung der Versuche im Labor anhand der ausgegeben Unterlagen und den Unterlagen zum Modul "Digitale Übertragung selbständig vor. Sie sind in der Lage, die für den jeweiligen Versuch notwendigen theoretischen Kenntnisse vor und während des Versuchs zu erklären und zur Lösung der Laboraufgaben und vorbereitenden Hausaufgaben einzusetzen. Sie dokumentieren die durchgeführten Versuche selbständig in ihren Unterlagen, so dass die Nachvollziehbarkeit der Arbeiten jederzeit gegeben ist. Die Arbeit im Labor organisieren sie in Kleingruppen (2-3 Personen) selbst. Sie erkennen die Notwendigkeit gewissenhafter Vorbereitung der Lerninhalte und disziplinierter Arbeitsweise im Labor.

Die Unterrichtssprache ist wahlweise Deutsch oder Englisch. Unterlagen werden ausschließlich auf Englisch zur Verfügung gestellt, weswegen die Studierenden die englischen Fachtermini kennen und nutzen.

----

Students deepen and extend their knowledge of digital message transmission methods and the associated mathematical principles by means of laboratory experiments. They analyze the properties of digital pulse amplitude modulation and variants of digital PAM. To this end, they generate transmit signals in the laboratory using the equipment provided and analyze them with the aid of standard measuring instruments (oscilloscope, rms meter). They build transmission links for these PAM methods and investigate the effects on the receiver side. They determine signal-to-noise ratios, error rates, etc.

Furthermore, the students implement their knowledge of the PAM transmission methods in self-created MATLAB routines, which model the simulation of a complete PAM transmission with transmitter, channel and receiver on the computer. In another experiment, students add an OFDM transmission to this model and analyze the operation of OFDM transmitters and receivers. They investigate the operation of loading algorithms in OFDM systems and implement them in MATLAB.

Students clarify the concept of signal space representation in digital transmission and implement an example system in MATLAB.

They create routines for Gram-Schmidt orthogonalization and FSK transmission in MATLAB. Students analyze simple MIMO scenarios and implement corresponding receiver algorithms.

The students independently prepare the experiments in the laboratory using the issued documents and the documents for the module "Digital

| 4 | <b>Module coordinator</b>             | Arslan Ali<br>Prof. Dr.-Ing. Georg Fischer<br>Prof. Dr.-Ing. Norman Franchi                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| 5 | <b>Contents</b>                       | <p>The lab course is based on the GNU Radio software platform. It includes a general introduction into GNU Radio, Python programming and Software Defined Radios (SDRs), as well as a more thorough introduction into USRPs.</p> <p>The students learn how to set up pure simulations of communication systems in Gnu Radio, how to use it in conjunction with Software Defined Radios and how to develop and test custom modules in Python. Regarding Gnu Radio the usage of different data types, variables, structures (e.g. vectors and streams), hierarchical development and flow control are part of the course.</p> <p>The course is structured into 8 exercises which first cover different modulation schemes like AM, PAM, and OFDM. In the later part of the course topics of practical relevance like synchronization (time, frequency, phase, frame) and equalization are covered. One synchronization scheme for OFDM is to be implemented by the students in Python. Most exercises have the goal to transmit audio data, first in a simulation, then in a loopback with one device and later between several devices.</p> <p>Setups to evaluate metrics like eye diagrams and EVM are introduced in a practical manner.</p> <p>Passing an introduction test is prerequisite for the participation in the lab course.</p> |  |
| 6 | <b>Learning objectives and skills</b> | <p>Students can</p> <ul style="list-style-type: none"> <li>• bridge the gap between communications theory, analog/digital baseband, and RF design</li> <li>• develop quick and flexible prototypes for real-time communications systems and standards using SDR solutions</li> <li>• determine the design parameters and assess the interaction between various analog and digital parts</li> <li>• create efficient Tx/Rx programs and signal processing algorithms in GNU Radio</li> <li>• implement channel estimation and equalization algorithms in TDD and FDD systems</li> <li>• demonstrate OFDM based systems</li> <li>• quantify and evaluate system performance using EVM and impairments analysis</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| 7 | <b>Prerequisites</b>                  | Prerequisite for this course is proper knowledge in the fundamentals of digital communications and digital signal processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| 8 | <b>Integration in curriculum</b>      | no Integration in curriculum available!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |

| 10 | <b>Method of examination</b>             | <p>Practical achievement</p> <p>At the begin of the lab course, the prerequisites are tested with a short (15 min) written test. Passing this test is required to participate in the experiments. The lab course itself consists of six experiments. At the end of every experiment the students have to present their respective final result. The understanding of the theoretical concepts will be check orally.</p> |
| 11 | <b>Grading procedure</b>                 | Practical achievement (100%)                                                                                                                                                                                                                                                                                                                                                                                            |

| 5 | <b>Contents</b>                       | <p>This is an advanced level lab course in machine learning. Imagine a car driving on an autobahn in an automatic mode. Among other things, the car needs to steer itself to keep driving in it's own lane. To accomplish this,</p> <p>the central problem is to detect the road-lane markings. These are the white solid or dashed lines that are drawn on each side of the lane. The standard modern approach to solve this type of problems is to take a large dataset of labeled examples and train a deep neural network model to accomplish the task. This is how car and pedestrian detection algorithms are developed. The difficulty with the road-lane markings is that there is no labeled dataset of them and creating such dataset would cost millions of dollars.</p> <p>In this lab course we will solve this problem using transfer learning and mathematical modeling:</p> <ul style="list-style-type: none"> <li>• Create cartoon-like artificial images of a road with known locations for the lane markings.</li> <li>• Train deep neural network on these artificial images with heavy data augmentations that mimic real-world images.</li> <li>• Create a dataset of unlabeled real-life videos by downloading and organizing examples from youtube.</li> <li>• Create a machine learning pipeline for working with these videos efficiently.</li> <li>• Apply the neural network that has been trained on artificial data to the real world videos.</li> <li>• Analyze the quality of results produced by the network.</li> <li>• Use mathematical modeling to correct the outputs of the network.</li> <li>• Retrain the network on the dataset composed of the corrected outputs.</li> <li>• Measure and analyze the quality of the results.</li> </ul> <p>The software will be written in Python using JupyterLab development framework. Access to modern GPU server will be provided. The best students will have the opportunity to contribute to the creation of state-of-the-art lane detection system for self-driving cars during or after the course.</p> |
| 6 | <b>Learning objectives and skills</b> | <p>Students are able to:</p> <ul style="list-style-type: none"> <li>• Independently design machine learning pipelines to solve complex problems in artificial intelligence.</li> <li>• Choose appropriate algorithms for the problem at hand.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 10 | <b>Method of examination</b>             | Practical achievement <ul style="list-style-type: none"> <li>• There are 6 experiments to complete. The details are described in the course materials.</li> <li>• Each experiment must be prepared in writing at home. The preparation will be checked and evaluated at the beginning of each experiment (sufficient/insufficient).</li> <li>• The results of each experiment must be recorded on the computers during the execution of the experiment (programming tasks) and are checked at the end of the experiment (sufficient/insufficient). The measured results must be documented.</li> <li>• To pass the course, 6 sufficient experiment preparations and 6 sufficient experiment executions are required.</li> <li>• One unsuccessful session can be repeated at the end of the course.</li> </ul> |

| 5 | <b>Contents</b>                       | <p>This is an advanced level lab course in machine learning. Imagine a car driving on an autobahn in an automatic mode. Among other things, the car needs to steer itself to keep driving in it's own lane. To accomplish this,</p> <p>the central problem is to detect the road-lane markings. These are the white solid or dashed lines that are drawn on each side of the lane. The standard modern approach to solve this type of problems is to take a large dataset of labeled examples and train a deep neural network model to accomplish the task. This is how car and pedestrian detection algorithms are developed. The difficulty with the road-lane markings is that there is no labeled dataset of them and creating such dataset would cost millions of dollars.</p> <p>In this lab course we will solve this problem using transfer learning and mathematical modeling:</p> <ul style="list-style-type: none"> <li>• Create cartoon-like artificial images of a road with known locations for the lane markings.</li> <li>• Train deep neural network on these artificial images with heavy data augmentations that mimic real-world images.</li> <li>• Create a dataset of unlabeled real-life videos by downloading and organizing examples from youtube.</li> <li>• Create a machine learning pipeline for working with these videos efficiently.</li> <li>• Apply the neural network that has been trained on artificial data to the real world videos.</li> <li>• Analyze the quality of results produced by the network.</li> <li>• Use mathematical modeling to correct the outputs of the network.</li> <li>• Retrain the network on the dataset composed of the corrected outputs.</li> <li>• Measure and analyze the quality of the results.</li> </ul> <p>The software will be written in Python using JupyterLab development framework. Access to modern GPU server will be provided. The best students will have the opportunity to contribute to the creation of state-of-the-art lane detection system for self-driving cars during or after the course.</p> |
| 6 | <b>Learning objectives and skills</b> | <p>Students are able to:</p> <ul style="list-style-type: none"> <li>• Independently design machine learning pipelines to solve complex problems in artificial intelligence.</li> <li>• Choose appropriate algorithms for the problem at hand.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Knut Graichen<br>Prof. Dr. Thomas Moor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 5  | <b>Contents</b>                          | In this seminar, students will perform a literature search on a recent research topic in the broader field of automatic control. Findings are to be summarized by a written report and by a class room presentation. All participants contribute to a critical discussion of the presented results. The specific topics are announced at the beginning of the semester.                                                                                                                                                                                                                                                                                             |
| 6  | <b>Learning objectives and skills</b>    | The students are able to <ul style="list-style-type: none"> <li>• conduct a literature research on a recent topic in the field of automatic control and appreciate the scientific contribution</li> <li>• summarize the scientific contribution in a written report and evaluate it in depth</li> <li>• prepare a presentation for a professional audience</li> <li>• perform the presentation in free speech and within a given time</li> <li>• present the scientific contribution clearly and to convince a professional audience of pros and cons</li> <li>• reflect on their contribution to the discussions following the individual presentations</li> </ul> |
| 7  | <b>Prerequisites</b>                     | The modules "Regelungstechnik A" and "Regelungstechnik B" or "Dynamical Systems and Control" are recommended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 8  | <b>Integration in curriculum</b>         | no Integration in curriculum available!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Knut Graichen                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5  | <b>Contents</b>                          | In this course, tasks from the field of mobile robotics are analyzed, developed, and practically implemented on a Boston Dynamics Spot. The results of a literature search as well as of their implementation are summarized by a written report and by a class room presentation.                                                                                                                                                                                                                                                                                                                                                                       |
| 6  | <b>Learning objectives and skills</b>    | <p>The students are able to</p> <ul style="list-style-type: none"> <li>• explain and apply scientific basics as well as specialized and in-depth knowledge in the field of mobile robotics</li> <li>• conduct largely independent application-oriented projects based on broad and specialized research methodologies of mobile robotics</li> <li>• work cooperatively and responsibly in groups and critically reflect and expand their own cooperative behaviour in groups</li> <li>• present complex technical content clearly and in a way that is appropriate for the audience and present arguments in a critical and reflective manner</li> </ul> |

| 4  | <b>Module coordinator</b>                | Prof. Dr. Vasileios Belagiannis                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 5  | <b>Contents</b>                          | The students will study, understand, and present scientific publications from the literature on machine learning and deep learning. At the end of the seminar, the student will be able to summarise and present a publication.<br>The seminar covers a wide range of research topics in the field of machine learning and deep learning, including generative and foundation models, different types of learning and applications machine learning. |
| 6  | <b>Learning objectives and skills</b>    | The students will learn to: <ul style="list-style-type: none"> <li>• Conduct literature reviews.</li> <li>• Present and analyse a scientific topic.</li> <li>• Write a report on a specific problem.</li> <li>• Discuss and communicate research findings.</li> </ul>                                                                                                                                                                                |
| 7  | <b>Prerequisites</b>                     | Basic knowledge in Machine Learning and Deep Learning beneficial                                                                                                                                                                                                                                                                                                                                                                                     |

| 4  | <b>Module coordinator</b>                | Prof. Dr. Anne Koelewijn                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 5  | <b>Contents</b>                          | Legged robotics help researchers understand human and animal locomotion. Furthermore, legged robots have many different applications, for example to aid in dangerous environments and in rehabilitation. Active prosthetics and exoskeletons improve gait of people with a disability, like a spinal cord injury or an amputation. The goal of this seminar is to become familiar with different algorithms and analysis methods that are used for legged robotics. Important concepts here are the energetics and the stability. Robots should be energy efficient, in the case of an exoskeleton to not lose battery power for a day. Obviously, stability is important to avoid falls. Each student will perform a literature review of a specific concept related to robot locomotion. The concepts can be chosen from a list, or the student can propose their own topic. Students can choose to perform an extra assignment to receive an additional 2.5 ECTS. The assignment will require the student to implement the chosen concept in simulation or in practice. |

| 10 | <b>Method of examination</b>          | Practical achievement<br>The lab course comprises ten sessions of four hours plus two sessions of two hours, which include 7 work packages, a subjective test, and a final presentation. Each work package requires a preparation in written form and will be checked and reviewed (pass/fail) before the start of each session. During each of the ten mandatory lab sessions, the students are required to work on programming tasks, which will be reviewed at the end of each session (pass/fail). After these ten programming sessions, a working video codec has to be handed in. Besides, the students have to participate a subjective test, where the codec results are evaluated. In the last session, each video codec has to be presented by the students. A certificate confirming the successful participation in the laboratory is received if all work packages have been sufficiently prepared and implemented, if the results of all work packages have been combined into a functional and |

Heinrich Löllmann                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5  | <b>Contents</b>                          | <p>In this laboratory course the theory from the lecture Digital Signal Processing is applied in practice, using the programming environment MATLAB. The topics include quantization, spectral analysis, FIR and IIR filter design, filter banks and adaptive filters. The course consists of 5 guided experiments in which students work on programming problems in groups of two, and a 5-day block course where each group works on an individual project from the field of digital signal processing.</p> <p>The preparation, as well as the results of the past experiment will be examined by a short test at the beginning of each experiment. For passing the lab course, a minimum number of points from the tests and the project is required.</p> <p>The course requires previous experience in MATLAB programming. It is possible to take the course in parallel to the DSP lecture, however, revision of the relevant lecture contents before each lab lesson, and participation in the DSP exercises and tutorials is required.</p> |
| 6  | <b>Learning objectives and skills</b>    | <p>The students</p> <ul style="list-style-type: none"> <li>• create MATLAB programs for the each experiments and, by this, apply knowledge acquired in the DSP lecture and supplement course</li> <li>• analyze and evaluate the implemented algorithms</li> <li>• understand the requirements for practical realizations of algorithms for digital signal processing</li> <li>• reflect the learning progress during the lab course.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 4 | <b>Module coordinator</b>             | Prof. Dr. Vasileios Belagiannis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5 | <b>Contents</b>                       | <p>This is an advanced level lab course in machine learning. Imagine a car driving on an autobahn in an automatic mode. Among other things, the car needs to steer itself to keep driving in it's own lane. To accomplish this,</p> <p>the central problem is to detect the road-lane markings. These are the white solid or dashed lines that are drawn on each side of the lane. The standard modern approach to solve this type of problems is to take a large dataset of labeled examples and train a deep neural network model to accomplish the task. This is how car and pedestrian detection algorithms are developed. The difficulty with the road-lane markings is that there is no labeled dataset of them and creating such dataset would cost millions of dollars.</p> <p>In this lab course we will solve this problem using transfer learning and mathematical modeling:</p> <ul style="list-style-type: none"> <li>• Create cartoon-like artificial images of a road with known locations for the lane markings.</li> <li>• Train deep neural network on these artificial images with heavy data augmentations that mimic real-world images.</li> <li>• Create a dataset of unlabeled real-life videos by downloading and organizing examples from youtube.</li> <li>• Create a machine learning pipeline for working with these videos efficiently.</li> <li>• Apply the neural network that has been trained on artificial data to the real world videos.</li> <li>• Analyze the quality of results produced by the network.</li> <li>• Use mathematical modeling to correct the outputs of the network.</li> <li>• Retrain the network on the dataset composed of the corrected outputs.</li> <li>• Measure and analyze the quality of the results.</li> </ul> <p>The software will be written in Python using JupyterLab development framework. Access to modern GPU server will be provided. The best students will have the opportunity to contribute to the creation of state-of-the-art lane detection system for self-driving cars during or after the course.</p> |
| 6 | <b>Learning objectives and skills</b> | <p>Students are able to:</p> <ul style="list-style-type: none"> <li>• Independently design machine learning pipelines to solve complex problems in artificial intelligence.</li> <li>• Choose appropriate algorithms for the problem at hand.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|    |                                          |                                                                                                                                                                                                                                                                                                                                                                            |

|    |                                          | <ul style="list-style-type: none"> <li>• Use standard packages for machine learning in Python: numpy, cvxpy, scikit-learn, pywavelets, pytorch.</li> <li>• Debug and calibrate machine learning algorithms. Develop modification to the standard algorithms as appropriate to the problem at hand.</li> <li>• Explain the theoretical aspects of deep learning.</li> </ul> |
| 7  | <b>Prerequisites</b>                     | Knowledge of Python programming language is required. Basic theoretical knowledge in machine learning is assumed: consider taking the Machine Learning in Signal Processing (MLSIP) course in the same semester.                                                                                                                                                           |

| 5  | <b>Contents</b>                       | The Seminar on Selected Topics of Multimedia Communications and Signal Processing deals with current research topics in the area of multimedia communications and signal processing. In an introductory meeting, the course of the seminar is outlined and each participant selects one of the offered topics. The participant should become familiar with the assigned research topic and present it by a report and a talk at the end of the seminar with the support of a supervisor. In an intermediate meeting about 5 weeks after the introductory meeting, the participants give a brief presentation about their topics and show first results. In addition, hints for the preparation of the final talk are provided at this meeting. At the end of the semester, a final one-day meeting takes place where each participant presents his topic in a talk of 30 minutes followed by a discussion and questions from the audience. In addition, each participant has to submit a report of about 10 pages about his topic a few days before the final meeting. |

| 4  | <b>Module coordinator</b>             | Prof. Dr.-Ing. Walter Kellermann                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5  | <b>Contents</b>                       | <p>In this laboratory course the theory from the lecture Digital Signal Processing is applied in practice, using the programming environment MATLAB. The topics include quantization, spectral analysis, FIR and IIR filter design, filter banks and adaptive filters.</p> <p>The course consists of 5 guided experiments in which students work on programming problems in groups of two, and a 5-day block course where each group works on an individual project from the field of digital signal processing.</p> <p>The preparation, as well as the results of the past experiment will be examined by a short test at the beginning of each experiment. For passing the lab course, a minimum number of points from the tests and the project is required.</p> <p>The course requires previous experience in Python programming. It is possible to take the course in parallel to the DSP lecture, however, revision of the relevant lecture contents before each lab lesson, and participation in the DSP exercises is strongly recommended.</p> |
| 6  | <b>Learning objectives and skills</b> | <p>The students</p> <ul style="list-style-type: none"> <li>• create functional Python programs for the individual pre-drawn experiments and apply the knowledge acquired in the lecture and exercise</li> <li>• analyze and evaluate the algorithm they have implemented</li> <li>• understand the requirements of practical implementations of digital signal processing algorithms</li> <li>• reflect on their own learning process during the lab course.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 5  | <b>Contents</b>                       | <p>Today, many image and video signal processing applications are running on embedded systems. However, the computational power and the energy storage is a limiting demand for embedded systems. Nevertheless, daily mobile devices like smartphone and tablet are able to perform signal processing tasks for image and video signals, for example coding of images and videos, the creation of a panorama or the calculation of images with high dynamic range.</p> <p>The image and video signal processing on embedded systems lab course should show the challenges that occur while handling with such mobile devices and the implementation of such algorithm on an embedded system. Therefore, Raspberry Pis as embedded systems and Python as coding language is used in the laboratory. The experiments include the setup of the Raspberry Pi, an introduction to Python and an introduction to image and video signal processing. In addition, a camera will be connected, signal processing will be done with the camera and digital filters are implemented. Moreover, the laboratory includes different computer vision applications like the creation of a panorama.</p> |

| 5  | <b>Contents</b>                       | The Seminar on Selected Topics of Multimedia Communications and Signal Processing deals with current research topics in the area of multimedia communications and signal processing. In an introductory meeting, the course of the seminar is outlined and each participant selects one of the offered topics. The participant should become familiar with the assigned research topic and present it by a report and a talk at the end of the seminar with the support of a supervisor. In an intermediate meeting about 5 weeks after the introductory meeting, the participants give a brief presentation about their topics and show first results. In addition, hints for the preparation of the final talk are provided at this meeting. |
| 6  | <b>Learning objectives and skills</b> | The students <ul style="list-style-type: none"> <li>• acquire and apply fundamental techniques to conduct a literature survey, and to prepare and present a technical topic</li> <li>• analyze and evaluate provided literature regarding the focus of their technical presentation</li> <li>• apply the knowledge acquired during their studies to deepen by themselves their technical focus</li> <li>• apply acquired knowledge to ask a presenter questions and to discuss the presentation</li> <li>• analyze and evaluate the presentations of other seminar participants.</li> </ul>                                                                                                                                                    |
