

# Module description

for the degree programme

Master of Science Nanotechnology

(Version of examination regulation: 20222)

for the winter term 2024/2025

# Table of contents

General materials properties	
Applied fundamentals (46201).....	6
Material characterization (46207).....	9
Iron and steel materials (46208).....	12
High-temperature materials (46203).....	14
Tribiology, surface finishing and damage analysis (46248).....	16
Macroscopic mechanical properties (46292).....	19
Materials science and engineering for metals	
Metallic Materials: Fundamentals and Technologies (46211).....	22
Metallic Materials: New Processes, Technologies and Materials (46212).....	25
Additive Manufacturing (46213).....	27
Metallic Materials in Automotive Engineering (46214).....	28
Powder Metallurgy (46216).....	30
1st and 2nd non-technical electives	
Material characterization (46207).....	33
Iron and steel materials (46208).....	36
Additive Manufacturing (46213).....	38
Metallic Materials in Automotive Engineering (46214).....	39
Powder Metallurgy (46216).....	41
Functional ceramics I (46223).....	43
Functional ceramics II (46224).....	45
Functional ceramics III (46225).....	47
Porous and cellular ceramics I (46226).....	49
Porous and cellular ceramics II (46227).....	51
Glass I (46228).....	53
Glass II (46229).....	55
Seminar module (46233).....	57
Surface analysis I (46237).....	59
Quality management (97246).....	62
Computer science for engineers I (97080).....	64
Advanced corrosion science (46288).....	66
Transmission electron microscopy in materials science II (46287).....	69
Scattering methods for nanostructured materials (46285).....	71
3D characterization in materials science (46284).....	73
Scanning electron microscopy in materials science and nanotechnology (46283).....	75
Foundations of phase field modelling (46276).....	77
Microstructure modeling (46275).....	78
Materials informatics (46274).....	79
Material theory (46273).....	80
Advanced applications: Composites and surfaces (46266).....	81
Advanced applications: Biofabrication and drug delivery (46265).....	86
Crystal growth 3 (46262).....	89
Crystal growth 1 (46259).....	90
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	93
Advanced semiconductor technologies: Solution processed semiconductors III: Processing (46256).....	95
Advanced semiconductor technologies: Solution processed semiconductors II: Processing (46255).....	98

Advanced semiconductor technologies: Solution processed semiconductors I: Materials - nanocrystals (46254).....	101
Photovoltaics (PV) and PV Systems II: Light conversion and light management (46253).....	103
Semiconductor devices and applications (46252).....	106
Elective module polymers (46247).....	108
Processing of polymer materials (46246).....	110
Surface analysis II (46238).....	112
Tribiology, surface finishing and damage analysis (46248).....	115
Applications of polymers II (46245).....	118
Rheology (46243).....	120
Machine learning for engineers I - Introduction to methods and tools (95067).....	122
Algorithms, programming, and data representation (92327).....	124
Automotive engineering II (95345).....	128
Master's thesis (1999).....	130
Nano Characterization (45740).....	132
Practical course synthesis/ characterization (45750).....	135
Computational Nanoscience (45761).....	137
Top-Down Nanostructuring (45770).....	139
Bottom-up Nanosynthesis / Self-assembly (45780).....	142
Scientific project (45865).....	147
Soft Skills (46219).....	150
Glass and ceramics	
Ceramic materials: Foundations and technologies (46221).....	154
Ceramic materials: Processing and properties (46222).....	158
Functional ceramics I (46223).....	160
Functional ceramics II (46224).....	162
Functional ceramics III (46225).....	164
Porous and cellular ceramics I (46226).....	166
Porous and cellular ceramics II (46227).....	168
Glass I (46228).....	170
Glass II (46229).....	172
Seminar module (46233).....	174
Surface science and corrosion	
Surface technology and electrochemistry (46234).....	177
Laboratory course: Corrosion and surface analysis (46235).....	183
Fundamentals of electrochemistry - Advanced (46236).....	185
Surface analysis I (46237).....	188
Surface analysis II (46238).....	191
Polymer materials	
Polymers (46241).....	195
Specialization: Polymers (46242).....	197
Rheology (46243).....	199
Applications of polymers II (46245).....	201
Materials for electronics and energy technology	
Semiconductor fundamentals, characterization, materials & processing (46251).....	204
Semiconductor devices and applications (46252).....	207
Photovoltaics (PV) and PV Systems II: Light conversion and light management (46253).....	209
Advanced semiconductor technologies: Solution processed semiconductors I: Materials - nanocrystals (46254).....	212
Advanced semiconductor technologies: Solution processed semiconductors II: Processing (46255).....	214

Advanced semiconductor technologies: Solution processed semiconductors III: Processing (46256).....	217
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	220
Crystal growth 2 (46258).....	222
PV systems III - PV technology (45089).....	224
<b>Biomaterials</b>	
Foundations of anatomy and physiology (22802).....	229
Basics of biomaterials (46263).....	231
Advanced applications: Tissue engineering (46264).....	235
Advanced applications: Biofabrication and drug delivery (46265).....	238
Advanced applications: Composites and surfaces (46266).....	241
<b>Materials simulation</b>	
Foundations of materials simulation (46271).....	247
Discrete and continuum simulation (46272).....	249
Material theory (46273).....	250
Materials informatics (46274).....	251
Microstructure modeling (46275).....	252
Foundations of phase field modelling (46276).....	253
<b>Micro- and nanostructure research</b>	
Applied micro- and nanostructure research (46282).....	255
3D characterization in materials science (46284).....	257
Scattering methods for nanostructured materials (46285).....	259
Fundamentals of micro- and nanostructure research NT (46291).....	261

# General materials properties

1	<b>Module name</b> 46201	<b>Angewandte Grundlagen</b> Applied fundamentals	<b>10 ECTS</b>
2	Courses / lectures	Vorlesung: Structural Materials I (2.0 SWS, WiSe 2024) Übung: Structural Materials I - Exercise (2.0 SWS, WiSe 2024)	3 ECTS 2,5 ECTS
3	Lecturers	Dr.-Ing. Steffen Neumeier Prof. Dr. Mathias Göken Annalena Meermeier	

4	<b>Module coordinator</b>	Prof. Dr. Mathias Göken
5	<b>Contents</b>	<p>*Angewandte Grundlagen I+II, V, 2x2 SWS, 5 ECTS*</p> <p>Blickpunkt steht die Beziehung zwischen Mikrostruktur / Aufbau der Werkstoffe und ihren mechanischen Eigenschaften. Hierzu werden grundlegende Verformungs- und Schädigungsmechanismen besprochen und auf technisch relevante Legierungen übertragen.</p> <p>Die Inhalte im Einzelnen:</p> <ul style="list-style-type: none"> <li>• Mechanische Eigenschaften (Ein- und Vielkristallverformung, Verformungsmechanismen)</li> <li>• Bruchmechanik (Grundlagen, Anwendungen)</li> <li>• mikrostruktureller und atomarer Aufbau auf unterschiedlichen Längenskalen sowie die daraus ableitbare Eigenschaften)</li> <li>• Verbundwerkstoffe</li> <li>• Simulationstechniken und deren Anwendung</li> <li>• Phasenumwandlungen und Ausscheidungskinetik</li> </ul> <p>*Übungen zu Angewandten Grundlagen I+II, 2x2 SWS, 5 ECTS*</p> <p>Anhand von Übungsaufgaben werden die Vorlesungsinhalte der VL Angewandte Grundlagen vertieft. Themenschwerpunkte:</p> <ul style="list-style-type: none"> <li>• Simulationstechniken</li> <li>• Verformungsmodelle</li> <li>• Ausscheidungskinetik</li> <li>• Experimentelle Techniken</li> <li>• Bruchmechanik</li> </ul> <p>Structural Materials (Applied Fundamentals) I+II, V, 2x2 SWS, 5 ECTS</p> <p>The focus is on the relationship between microstructure / structure of materials and their mechanical properties. Basic deformation and damage mechanisms are discussed and applied to technically relevant alloys. The contents in detail:</p> <ul style="list-style-type: none"> <li>• Mechanical properties (single and multi-crystal deformation, deformation mechanisms)</li> <li>• Fracture mechanics (fundamentals, applications)</li> <li>• microstructural and atomic structure on different length scales and the properties that can be derived from them)</li> <li>• composite materials</li> <li>• simulation techniques and their application</li> <li>• phase transformations and precipitation kinetics</li> </ul> <p>Exercises on Structural Materials (Applied Fundamentals) I+II, 2x2 SWS, 5 ECTS</p>

	<ul style="list-style-type: none"> <li>The lecture contents of the lecture Applied Fundamentals are deepened by means of exercises. Main topics:</li> <li>Simulation techniques</li> <li>deformation models</li> <li>Precipitation kinetics</li> <li>Experimental techniques</li> <li>Fracture mechanics</li> </ul>
6	<p><b>Learning objectives and skills</b></p> <p>*Fachkompetenz*</p> <p>Evaluieren (Beurteilen)</p> <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>vertiefen ihr Wissen über die vielfältigen strukturellen Aufbauten der Werkstoffe und können diese beurteilen</li> <li>vertiefen das Verständnis über die Zusammenhänge zwischen der chemischen Zusammensetzung, der Struktur und den Eigenschaften von Werkstoffen</li> <li>können Legierungsthermodynamik anwenden und Zustandsdiagrammen analysieren</li> <li>vertiefen das Wissens zu den mechanischen Eigenschaften und Härtungsmechanismen</li> <li>können Struktur-Eigenschaftskorrelationen erschließen und überprüfen</li> <li>beurteilen eigenständig Struktur-Eigenschaftsbeziehungen an Beispielen</li> <li>verstehen die Vorgänge und Eigenschaften von Werkstoffen auf verschiedenen Größenskalen</li> <li>erwerben fundierter Kenntnisse über die Grundlagen zum Aufbau der verschiedenen Werkstoffklassen, Charakterisieren unterschiedlicher Strukturen</li> <li>vertiefen ihr Verständnis der Zusammenhänge zwischen Aufbau, thermomechanischer Vorgesichte und Eigenschaften der Werkstoffe und können diese erklären</li> <li>wenden und beurteilen Simulationsmethoden und können diese klassifizieren</li> <li>vertiefen die erlernten Inhalte durch Übungen und Praktikum</li> <li>erlernen und wenden neuen Methoden an</li> <li>deepen their knowledge of the various structural compositions of materials and are able to evaluate them</li> <li>deepen their understanding of the relationships between the chemical composition, structure and properties of materials</li> <li>can apply alloy thermodynamics and analyze state diagrams</li> <li>deepen knowledge of mechanical properties and hardening mechanisms</li> <li>can develop and verify structure-property correlations</li> <li>independently evaluate structure-property relationships using examples</li> <li>understand the processes and properties of materials on different size scales</li> </ul>

		<ul style="list-style-type: none"> <li>• acquire a sound knowledge of the fundamentals of the structure of the various classes of materials, characterize different structures</li> <li>• deepen their understanding of the relationships between structure, thermomechanical history and properties of materials and can explain them</li> <li>• apply and evaluate simulation methods and can classify them</li> <li>• deepen the learned contents by exercises and practical training</li> <li>• learn and apply new methods</li> <li>•</li> </ul> <p>*Lern- bzw. Methodenkompetenz*</p> <p>Neue Methodenkompetenzen, die erworben werden können:</p> <ul style="list-style-type: none"> <li>• Simulationstechniken</li> <li>• Materialwissenschaftliche Lösungsstrategien</li> </ul> <p>Learning or methodological competencies New methodological competencies that can be acquired:</p> <ul style="list-style-type: none"> <li>• Simulation techniques</li> <li>• Material science solution strategies</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	General Materials Properties Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Oral mündliche Prüfung (30 min.) oral exam (30 minutes)
11	<b>Grading procedure</b>	Oral (100%)
12	<b>Module frequency</b>	Only in winter semester
13	<b>Workload in clock hours</b>	Contact hours: 120 h Independent study: 180 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	

1	<b>Module name</b> 46207	<b>Materialcharakterisierung</b> Material characterization	<b>5 ECTS</b>
		Vorlesung: Atom Probe Tomography (1.0 SWS, WiSe 2024)  Vorlesung mit Übung: Anforderungen der Industrie an Werkstoffingenieure (2.0 SWS, WiSe 2024)  Vorlesung mit Übung: Atomsondenmikroskopie_School (1.0 SWS, WiSe 2024)	1 ECTS  3 ECTS  1 ECTS
2	Courses / lectures	Sonstige Lehrveranstaltung: Vorbesprechung Praktika in Mastermodulen WW 1 inkl. Sicherheitsbelehrung (0.0 SWS, WiSe 2024)  Sonstige Lehrveranstaltung: Vorbesprechung der Lehrveranstaltungen WW I (0.0 SWS, WiSe 2024)  Vorlesung mit Übung: Röntgenmethoden in der Materialanalyse (1.0 SWS, WiSe 2024)	-  -  1,5 ECTS
3	Lecturers	Prof. Dr. Peter Felfer Prof. Dr. Peter Weidinger apl. Prof. Dr. Heinz Werner Höppel Dr.-Ing. Steffen Neumeier Dr. Michael Wurmshuber Prof. Dr. Mathias Göken	

4	<b>Module coordinator</b>	Dr.-Ing. Steffen Neumeier
		Quantitative Gefügeanalyse, V+Ü, 1 SWS, 1 ECTS <ul style="list-style-type: none"> <li>• Einführung in die Quantitative Gefügeanalyse und die dazugehörigen Meßmethoden</li> <li>• Auswertemethoden</li> <li>• Grundlagen der Statistik</li> <li>• Praktische Anwendung von Image C</li> </ul> Röntgenmethoden in der Materialanalyse, V, 1 SWS, 1 ECTS <ul style="list-style-type: none"> <li>• Grundlagen der Röntgen-/Synchrotron-/Neutronenbeugung</li> <li>• Experimentelle Methoden</li> <li>• Anwendung in der Materialanalyse (Gitterkonstantenbestimmung, Spannungsanalyse, Texturanalyse,)</li> </ul> Anforderungen der Industrie an einen Werkstoffingenieur: <ul style="list-style-type: none"> <li>• Grundlagen industrieller Planungen im Werkstoffumfeld</li> <li>• Industrielle Lösungsstrategien bei Werkstofffragestellungen</li> <li>• Industrielle Charakterisierungsverfahren</li> </ul> Quantitative Microstructural Analysis, V+Ü, 1 SWS, 1 ECTS <ul style="list-style-type: none"> <li>• Introduction to quantitative microstructure analysis and the corresponding measuring methods</li> <li>• Evaluation methods</li> <li>• Basics of statistics</li> <li>• Practical application of Image C</li> </ul> X-ray methods in materials analysis, V, 1 SWS, 1 ECTS <ul style="list-style-type: none"> <li>• Basics of X-ray/synchrotron/neutron diffraction</li> </ul>
5	<b>Contents</b>	

	<ul style="list-style-type: none"> <li>• Experimental methods</li> <li>• Application in material analysis (determination of lattice constants, stress analysis, texture analysis,...)</li> </ul> <p>Fundamentals of Failure Analysis, V+Ü+P 0.5+1+0.5 SWS, 0.5+1+0.5 ECTS</p> <ul style="list-style-type: none"> <li>• Basic procedure of damage analysis</li> <li>• Damage hypotheses</li> <li>• Case studies from practice</li> <li>• Practical test to deepen the contents</li> </ul>

4	<b>Module coordinator</b>	Tobias Fey Prof. Dr. Kyle Grant Webber
5	<b>Contents</b>	<p><b>Structural analysis of functional ceramics using advanced diffraction techniques</b></p> <p>This course will cover basic crystallography, advanced diffraction techniques (e.g., x-ray, neutron and electron) including instrumentation, strategies to collect diffraction data (ex situ and in situ) and different data analysis methods. The course has been designed in such a way that, in addition to the development of theoretical background, students can have hands-on experience with different data analysis methods and software. At the initial stage we will cover basics of crystallography and principle of diffraction technique. An in-depth discussion on different (e.g., x-ray, 2D x-ray, neutron and electron) diffraction techniques and their use in the field of materials science and engineering will then be presented. In the next step we will discuss ferroelectric/ferroelastic materials and how diffraction technique can be used to investigate microscopic origin of macroscopic functional properties.</p> <p><b>Exercises for functional ceramics II: Structural Analysis</b></p> <p>Students will learn how to extract various structural parameters using different data analysis (e.g. Selected peak-fitting, Le Bail fitting and Rietveld structural refinement) techniques and how these structural parameters can be correlated with different macroscopic properties. A brief overview of the recent developments and future scopes in the field of structural analysis (e.g., 3D- XRD, diffuse scattering) using diffraction technique will be highlighted to conclude the course</p>
6	<b>Learning objectives and skills</b>	<p><b>The students</b></p> <ul style="list-style-type: none"> <li>• know the necessary scientific and practical knowledge for the microstructural characterization of ceramics using diffraction methods.</li> <li>• have an in-depth understanding of the following properties of ceramics: electrical, thermal and mechanical properties</li> <li>• understand the influences of structure and microstructure on electromechanical properties</li> <li>• know and understand how diffraction techniques work and what basic models are available for analysis</li> <li>• can use the appropriate software.</li> </ul>

5	<b>Contents</b>	Mechanical Properties and Fracture of Ceramics    • ◦ Das Laborpraktikum vermittelt praktische Erfahrungen in der makroskopischen mechanischen Charakterisierung von keramischen Werkstoffen, wobei speziell linear elastische und ferroelastische Werkstoffe untersucht werden. *English*  Mechanical Properties and Fracture of Ceramics   This course will introduce participants to the origins of the mechanical behavior of ceramic materials through discussions of atomic structure and microstructure. Here, participants will be introduced to linear elastic fracture mechanics and some concepts related to nonlinear fracture mechanics. Then, various toughness mechanisms will be presented and discussed, including phase transformation, ferroelasticity, and crack bridging. In the final section of the lecture, fractographic techniques for the analysis of fracture surfaces as well as subcritical crack growth will be presented.  Exercise for Functional Ceramics III: Mechanical Properties   This laboratory practical course provides hands-on experience in the macroscopic mechanical characterization of ceramic materials, specifically studying linear elastic and ferroelastic materials.
6	<b>Learning objectives and skills</b>	Die Studierenden <ul style="list-style-type: none"><li>• lernen die Ursprünge der mechanischen Eigenschaften von Keramiken kennen</li><li>• verstehen, wie sich keramische Werkstoffe nichtlinear, hysteretisch oder plastisch verformen können und wie dies das Bruchverhalten beeinflussen kann</li><li>• erlernen der Grundlagen der linear-elastischen Bruchmechanik, insbesondere der Hintergründe der Energiefreisetzungsraten und des Spannungsintensitätsfaktors</li><li>• verstehen Bruchflächen zur Analyse der Bruchentstehung genutzt werden können</li><li>• verstehen, wo Risse unterkritisch wachsen können und können diese charakterisieren</li></ul> *English* The students

5	<b>Contents</b>	<p>Glass formulation using project management:            Intensive exercise of 6 half days at the end of the semester.            The teaching follows an "on time approach. After presentation of the case study, an introduction to the project management is given. Analytical tools are given to the students than can use them directly on the case study. The project is then defined through brainstorming followed by Solution analysis and quotation. The rules for scheduling, monitoring and controlling a project are introduced before the case study is started to be solved. An emphasis is given on reporting by quick presentation at the end of each half day by the project team. In conclusion a last time is taken to analyze the personal issues encounter during these six half days. That help the students to have a pragmatic thinking about what could have been a better project team and the need of a leader.</p> <p>Glass and Ceramic for Energy-technology:</p> <ul style="list-style-type: none"> <li>• Materials and energy</li> <li>• Solar Energy</li> <li>• Solar Thermal</li> <li>• Photovoltaic Energy</li> <li>• Insulation</li> <li>• Wind Energy</li> <li>• Nuclear waste glass storage</li> <li>• Energy in glass processing</li> <li>• Fuel Cell and Ion conductivity</li> <li>• Lighting LED and LASER REE technology</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Patrik Schmuki
5	<b>Contents</b>	<p>*Surface Analysis I + II (VL+Ü)*</p> <p>The generation of nanostructured materials gained relevance in the recent years and efficient characterization methods were developed, permitting insight into the topographical and chemical nanostructure of materials. The scope of this course covers a range of surface analytical instruments, discussing their principle mode of operation, application and data interpretation. All discussed instruments are also available at the chair and tutorials at the machines are a part of the lecture. The fabrication of nanostructured materials from particles to complex 3 dimensional structures is the topic of the second part of this lecture.</p> <p>Die Strukturierung von Werkstoffoberflächen auf der Nanoskala erlangte in jüngster Vergangenheit große Bedeutung was nicht zuletzt auf der Entwicklung hocheffizienter Charakterisierungsmethoden fußt. Diese erlauben eine hochauflösende Analyse der topografischen sowie chemischen Natur der Oberfläche. Im Zuge dieser Lehrveranstaltung (Teil I) werden eine Vielzahl Oberflächenanalytischer Verfahren und Instrumente erläutert und deren Funktionsprinzip und etwaige Betriebsmodi besprochen, wobei auch auf die Messdateninterpretation Wert gelegt wird. Für die am LS vorhandenen Verfahren erfolgt außerdem eine Begehung der Labore wobei die Studierenden einen konkreten Eindruck der diversen Techniken erhalten können.</p> <p>Im zweiten Teil der Lehrveranstaltung (Teil II) wird die Darstellung nanostrukturierter Werkstoffe besprochen. Hierbei wird auf Partikel bis hin zu komplexen dreidimensionalen Strukturen eine große Bandbreite der Oberflächenmodifikation abgedeckt.</p> <p>*Seminar Surface Science and Corrosion*</p> <p>Das Seminar Surface Science and Corrosion bietet die Gelegenheit Einblicke in den aktuellen Stand der Forschungsfelder des Lehrstuhls zu erlangen. Hierbei werden Fallbeispiele präsentiert und diskutiert und so ein tiefgehendes Verständnis der Messmethoden, welche in der VL Surface Analysis vermittelt werden, ermöglicht. Neben dieser inhaltlichen Komponente der Art eines Frontalunterrichtes, ist es möglich und sehr erwünscht die Thematiken zu diskutieren. Den Studierenden ist es hierbei neben dem Erwerb von Fachwissen möglich, einen ersten Eindruck vom Ablauf wissenschaftlicher Konferenzen bzw. Tagungen zu erhalten.</p> <p>The seminar Surface science and Corrosion offers the opportunity to gather insights into the current research areas of the chair. In the course</p>

	<p>of the seminar results are presented and discussed what enables a profound understanding of the techniques that are taught within the lecture Surface Analysis. Besides this factual part, the students have furthermore the chance (and are supposed) to ask questions to the speakers. This is an important insight into the academic working environment that might be especially relevant for prospective PhD-students.</p>
6	<p>Surface Analysis I + II (VI+Ü):</p> <p><b>Die Studierenden</b></p> <ul style="list-style-type: none"> <li>• verstehen fundamentaler Konzepte im Bereich Kristallographie</li> <li>• Können Vor- und Nachteile verschiedener Verfahren der Oberflächencharakterisierung kritisch diskutieren</li> <li>• verstehen die theoretischen Grundlagen von STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS</li> <li>• kennen verschiedener Herstellungsmethoden für Nanostrukturen und Anwendung von CVD.</li> <li>• verstehen das Prinzip des Sol-Gel Prozesses</li> <li>• kennen die Anwendungen nanostrukturierter Oberflächen</li> <li>• kennen und verstehen Verfahren zur Oberflächenanalyse bei Nanomaterialien</li> </ul> <p><b>The students:</b></p> <ul style="list-style-type: none"> <li>• Describing of basic concepts in crystallography.</li> <li>• Evaluating different kinds of surface characterization techniques (pros and cons).</li> <li>• Elucidating the theoretical background of STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS.</li> <li>• Defining fabrication methods of nanostructures and elucidation of nanostructured CVD.</li> <li>• Describing the sol-gel process.</li> <li>• Reporting applications of nanostructured surfaces.</li> <li>• Elucidation of surface analytical techniques for nanomaterial characterization.</li> </ul> <p><b>Seminar Surface Science and Corrosion</b></p> <p><b>Die Studierenden</b></p> <ul style="list-style-type: none"> <li>• wenden wissenschaftlicher Verfahren und Techniken in der Forschung (Beispiele)an</li> <li>• haben Erfahrung bezüglich des Ablaufs und der Gepflogenheiten im wissenschaftlichen Arbeitsumfeld durch aktive Teilnahme an Diskussionen.</li> <li>• besitzen Softskills als Vorbereitung auf eine wissenschaftliche Karriere</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Appliance of scientific techniques in research (discussion of examples).</li> <li>• Generating experience in scientific community.</li> <li>• Participation in scientific discussions.</li> <li>• Acquiring of soft-skills for futural scientific careers.</li> </ul>

2	Courses / lectures	Vorlesung mit Übung: Scattering Methods for Nanostructured Materials  Übung: Exercise Scattering Methods for Nanostructured Materials	3 ECTS  2 ECTS
3	Lecturers	Dr. Johannes Will	

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	The module focuses on the application of scattering methods for crystal structure determination in general (diffraction), the investigation of supported nanostructures and thin films (grazing incidence diffraction and reflectometry) and for the size and shape analysis of nanostructures in solution (small-angle scattering). Basic concepts of Fourier transforms will be applied to the interaction of a primary probe with a periodically ordered object. Moreover, the impact of multiple scattering events on the diffracted intensity and its angular dependence will be discussed in a unified model for neutrons, x-rays and electrons. Those theoretical considerations will built the basis for the understanding of the methods named above. For all methods, current published research examples will be showcased.
6	<b>Learning objectives and skills</b>	<p><b>The students</b></p> <p>Understanding professional competences</p> <p>Basics of Fourier transform and convolution</p> <p>Understanding of the interaction of neutrons, x-rays and electrons with atoms and their arrays</p> <p>Physical principles of the interaction of a scattering probe with an extended crystalline lattice</p> <p>Understanding how scattering methods contribute and which kind of information can be extracted for todays challenges in material science</p> <p><b>Appliation</b></p> <p>Each topic will be accompanied with suitable exercises</p>

3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	The module focuses on the application of 3D characterization methods in materials science. Techniques on different length scales (meters down to angstroms) using different probes (e.g. visible light, X-rays, electrons) are covered. The aim of this module is to give an overview over available techniques, to teach the underlying physical principles and to point out specific advantages, challenges and limits, demonstrated on recent research examples. Focal topics are transmission tomography methods on the nano- and microscale, namely high-resolution X-ray computed tomography (Nano-CT) and electron tomography. Sample preparation, data acquisition, 3D reconstruction, data handling and analysis are taught in both the lecture and the practical course. The theoretical background of 3D reconstruction techniques for transmission tomography is also part of the lecture.
6	<b>Learning objectives and skills</b>	<p><b>Professional competence</b></p> <p><b>Knowledge</b></p> <p>Overview over 3D characterization techniques on different length scales using different probes, demonstrated on recent research examples</p> <p><b>Understanding</b></p> <p>Understand the underlying physical principles and specific advantages, challenges and limits of different 3D techniques in materials science</p> <p><b>Analyzing</b></p> <p>Learn theoretical and practical aspects of sample preparation, data acquisition, 3D reconstruction and analysis of transmission tomography on the nanoscale</p>

Surface properties which are relevant for protein and cell attachment are discussed. Fundamentals of protein and protein adsorption on biomaterials are presented as well as the effect of chemical composition, topography, hydrophobic and hydrophilic surfaces, stiffness of the biomaterial and ion release effects from the biomaterial on cell attachment and success of the implanted material in general. The lecture also gives surface modification strategies for implants and scaffolds including biomedical coatings and bioactive surfaces. The course covers also functionalization strategies for biomaterials. Protein adsorption mechanisms and the basics of the interaction between a biomaterial (implant) and tissues (foreign body reaction) are covered. #### \*Dentale Biomaterialien\*

##### Die Studierenden

- kennen den Aufbau und die Struktur von Zähnen und die daraus abgeleiteten mechanischen und physikalischen Eigenschaften.
- kennen die Struktur und die Zusammensetzung dentaler Biomaterialien wie hochgefüllte Polymere, Dentalkeramiken oder Titanimplantate.
- verstehen die relevanten Krankheitsbilder, die zum Zahnverlust führen können und bekommen Einblick in die Kariesätiologie.
- entwickeln das Verständnis für die Prinzipien dentaler Konstruktionslehre (Kavitätenpräparation) im Hinblick auf die unterschiedlichen Restaurationsmaterialien und Befestigungstechniken.
- klassifizieren die Prinzipien der dentalen Befestigungstechnik und speziell der adhäsiven Klebetechnik.
- können den Unterschied zwischen direkter, plastischer Füllungstherapie und indirekten, prosthetischen Restaurationen diskutieren.
- sind in der Lage dentale Biomaterialien, anwendungsspezifisch hinsichtlich mechanischer, physikalischer, chemischer und biologischer Eignung zu untersuchen.

#### |\*Educational objectives and competences:\*

#### \*Composite Materials and Nanomaterials in Medical Technology\*

##### The students

- obtain an overview on the current and future nanomaterials used in medical technology.
- know specific properties, applications and advantages of nanocomposites.
- understand the composition and development of such composite materials for medical technology for applications such as coatings, scaffolds, drug-delivery systems and antimicrobial surfaces

#### \*Biomaterial Interfaces und Werkstoffoberflächen in der Medizin/Material surfaces in medicine\*

##### The students

- learn the basics of different aspects of interfaces of biomaterials. In particular, focus will be placed on the interaction between different biomaterials (polymers, metals, ceramics) with the physiological fluids and the surrounding tissue.
- can apply their knowledge in order to judge the success of the different biomaterials and to optimize the surface properties for specific applications
- know and can explain methods of surface characterization.

#### \*Dental biomaterials\*

##### The students

		<ul style="list-style-type: none"> <li>• know the structure of a tooth and their mechanical and physical properties.</li> <li>• understand the structure and the composition of dental biomaterials, such as highly filled polymers, dental ceramics or titanium implants.</li> <li>• understand the relevant clinical pictures, which lead to tooth loss, and an insight into the etiology of caries formation.</li> <li>• develop an understanding for the principles of dental design theory (Cavity preparation) with view to the different restoration materials and fixation techniques,</li> <li>• classify the principles of dental fixation techniques, in particular the adhesive technique.</li> <li>• can discuss the difference between direct, plastic restorative therapy and indirect, prosthetic restorations.</li> <li>• are able to examine dental biomaterials from a user specific standpoint regarding mechanical, physical, chemical and biological suitability.</li> </ul>

3	Lecturers	Prof. Dr. Christoph Brabec	

4	<b>Module coordinator</b>	Prof. Dr. Christoph Brabec Prof. Dr. Wolfgang Heiß
5	<b>Contents</b>	<b>Lecture / Exercise / Lab work</b>  The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Shottky and Hetero Junction are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed.</li> <li>Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.</li> </ul>
7	<b>Prerequisites</b>	Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, or comparable
8	<b>Integration in curriculum</b>	semester: 1

4	<b>Module coordinator</b>	Prof. Dr. Christoph Brabec
5	<b>Contents</b>	<p><b>Lecture / Exercise / Lab work</b></p> <p>The lecture will introduce into the specifics of electronic transport in disordered semiconductors as compared to inorganic semiconductors. As a consequence of the transport properties, quite unique device architectures are developed for disordered semiconductor devices. As a prototype representative, organic semiconductor devices (organic solar cells and LEDs) are discussed in more detail.</p>
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the major electronic transport models for disordered semiconductors. Marcus theory is introduced to describe charge migration. The Gaussian Disorder Modell is introduced to derive the temperature and field dependence of mobility and conductivity.</li> <li>Organic LEDs are one of the leading display technologies nowadays. Materials concepts for OLEDs, recombination of singlet and triplet populations, energy transfer, device architecture and production aspects are discussed Organic Photovoltaics is an emerging PV Technology. The leading materials concepts and composites for OPV are bilayer and bulk heterojunction concepts, charge generation and charge recombination is discussed as a function of microstructure.</li> <li>Single junction and tandem junction architectures are analysed, steady state and transient measurement methods are introduced to characterize such devices.</li> <li>Processing and characterization of organic, perovskite, etc solar cells, LEDs , displays or X-Ray detectors will be trained in the lab work.</li> </ul>

3	Lecturers		

4	<b>Module coordinator</b>	Hans-Joachim Egelhaaf
5	<b>Contents</b>	<p><b>Lecture / Exercise / Lab work</b></p> <p>The lecture will give an introduction to coating and printing technologies for the manufacturing of (opto-)electronic devices by solution processing. Special emphasis will be on upscaling from lab scale devices to large area commercial products. The fundamentals of the different technologies as well as their application for the manufacturing of active layers, transparent electrodes and transparent barriers will be described in detail. Exercises will provide a more quantitative approach to thin film processing while lab work will allow hands on experience of the lecture content.</p>
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>• The students will be introduced to the inventory of printing, coating and patterning technologies available for the solution processing of organic, hybrid and inorganic (opto-)electronic devices (FETs, LEDs, solar cells and photodetectors) and its application to the manufacturing of organic, perovskite and quantum dot devices.</li> <li>• After discussing the fundamentals of wet film deposition (wetting, viscosity, drying), the working principles and application ranges of coating (spin coating, doctor blading, slot die coating), printing (letter press, gravure, flexo, screen, ink jet printing) as well as of patterning techniques (printing, scratching, laser ablation) will be introduced.</li> <li>• The specific requirements of "printed electronics will be introduced and compared to those of "silicon based electronics on one hand and "visual printing on the other hand.</li> <li>• The students will learn how to manufacture transparent electrodes (thin metal films, finger electrodes, nanowire meshes, transparent conductive oxides), active layers (bulk heterojunctions, perovskite films, nanoparticle layers), and barriers from the respective inks. They will also learn how to decide for the appropriate coating/printing technology. The inventory of materials for printed electronics will be presented and concepts for rational development of inks from these materials (Hansen solubility theory) will be introduced.</li> <li>• Exercises will teach the students to base their decisions for materials, coating/printing technologies and patterning</li> </ul>

		<p>methods on quantitative considerations. These will include the calculation of resistance losses in transparent electrodes, of the viscosities and surface tensions of inks as well as of the water vapor transmission rates of barriers.</p> <ul style="list-style-type: none"> <li>Deposition and patterning of electrodes, active layers, and barriers for organic or perovskite solar cells will be trained in the lab work.</li> </ul>

1	<b>Module name</b> 46238	<b>Oberflächenanalyse II</b> Surface analysis II	<b>5 ECTS</b>
2	Courses / lectures	Seminar: Seminar Surface Science and Corrosion	-
3	Lecturers	Prof. Dr. Patrik Schmuki Prof. Dr. Sannakaisa Virtanen	

4	<b>Module coordinator</b>	Prof. Dr. Patrik Schmuki
5	<b>Contents</b>	<p><b>*Surface Analysis I + II (VL+Ü)*</b></p> <p>The generation of nanostructured materials gained relevance in the recent years and efficient characterization methods were developed, permitting insight into the topographical and chemical nanostructure of materials. The scope of this course covers a range of surface analytical instruments, discussing their principle mode of operation, application and data interpretation. All discussed instruments are also available at the chair and tutorials at the machines are a part of the lecture. The fabrication of nanostructured materials from particles to complex 3 dimensional structures is the topic of the second part of this lecture.</p> <p>Die Strukturierung von Werkstoffoberflächen auf der Nanoskala erlangte in jüngster Vergangenheit große Bedeutung was nicht zuletzt auf der Entwicklung hocheffizienter Charakterisierungsmethoden fußt. Diese erlauben eine hochauflösende Analyse der topografischen sowie chemischen Natur der Oberfläche. Im Zuge dieser Lehrveranstaltung (Teil I) werden eine Vielzahl Oberflächenanalytischer Verfahren und Instrumente erläutert und deren Funktionsprinzip und etwaige Betriebsmodi besprochen, wobei auch auf die Messdateninterpretation Wert gelegt wird. Für die am LS vorhandenen Verfahren erfolgt außerdem eine Begehung der Labore wobei die Studierenden einen konkreten Eindruck der diversen Techniken erhalten können. Im zweiten Teil der Lehrveranstaltung (Teil II) wird die Darstellung nanostrukturierter Werkstoffe besprochen. Hierbei wird auf Partikel bis hin zu komplexen dreidimensionalen Strukturen eine große Bandbreite der Oberflächenmodifikation abgedeckt.</p> <p><b>*Seminar Surface Science and Corrosion*</b></p> <p>Das Seminar Surface Science and Corrosion bietet die Gelegenheit Einblicke in den aktuellen Stand der Forschungsfelder des Lehrstuhls zu erlangen. Hierbei werden Fallbeispiele präsentiert und diskutiert und so ein tiefgehendes Verständnis der Messmethoden, welche in der VL Surface Analysis vermittelt werden, ermöglicht. Neben dieser inhaltlichen Komponente der Art eines Frontalunterrichtes, ist es möglich und sehr erwünscht die Thematiken zu diskutieren. Den Studierenden ist es hierbei neben dem Erwerb von Fachwissen möglich, einen ersten Eindruck vom Ablauf wissenschaftlicher Konferenzen bzw. Tagungen zu erhalten.</p> <p>The seminar Surface science and Corrosion offers the opportunity to gather insights into the current research areas of the chair. In the course of the seminar results are presented and discussed what enables a profound understanding of the techniques that are taught within</p>

		the lecture Surface Analysis. Besides this factual part, the students have furthermore the chance (and are supposed) to ask questions to the speakers. This is an important insight into the academic working environment that might be especially relevant for prospective PhD-students.
6	<b>Learning objectives and skills</b>	<p><b>Surface Analysis I + II (VI+Ü):</b></p> <p><b>Die Studierenden</b></p> <ul style="list-style-type: none"> <li>• beschreiben fundamentale Konzepte im Bereich Kristallographie.</li> <li>• diskutieren die Vor- und Nachteile verschiedener Verfahren der Oberflächencharakterisierung.</li> <li>• verstehen die theoretischen Grundlagen von STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS.</li> <li>• kennen verschiedene Herstellungsmethoden für Nanostrukturen und Anwendung von CVD.</li> <li>• verstehen den sol-gel Prozesses und können ihn wiedergeben.</li> <li>• kennen verschiedene Anwendungen nanostrukturierter Oberflächen.</li> <li>• Können Verfahren zur Oberflächenanalyse bei Nanomaterialien kritisch diskutieren.</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Describing of basic concepts in crystallography.</li> <li>• Evaluating different kinds of surface characterization techniques (pros and cons).</li> <li>• Elucidating the theoretical background of STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS.</li> <li>• Defining fabrication methods of nanostructures and elucidation of nanostructured CVD.</li> <li>• Describing the sol-gel process.</li> <li>• Reporting applications of nanostructured surfaces.</li> <li>• Elucidation of surface analytical techniques for nanomaterial characterization.</li> </ul> <p><b>Seminar Surface Science and Corrosion</b></p> <p><b>Die Studierenden:</b></p> <ul style="list-style-type: none"> <li>• wenden wissenschaftliche Verfahren und Techniken in der Forschung (Beispiele) an.</li> <li>• haben Erfahrung in Bezug auf Ablauf und Gepflogenheiten im wissenschaftlichen Arbeitsumfeld durch aktive Teilnahme an Diskussionen.</li> <li>• erwerben Softskills (VortraDarstellung / Diskussion) zur Vorbereitung auf eine wissenschaftliche Karriere.</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Appliance of scientific techniques in research (discussion of examples). 5	<b>Contents</b>	This is an introductory course presenting fundamental algorithms of machine learning (ML) that are typically applied to data science problems. Knowledge is deepened by two practical exercises to gain hands-on experience. The course covers <ul style="list-style-type: none"> <li>• Introduction to Python programming in the field of data science</li> <li>• Review of typical task domains (such as regression, classification and dimensionality reduction)</li> <li>• Theoretical understanding of widely used machine learning methods (such as linear and logistic regression, support vector machines (SVM), principal component analysis (PCA) and deep neural networks (DNN))</li> <li>• Practical application of these machine learning methods on engineering problems</li> </ul>
6	<b>Learning objectives and skills</b>	After successfully participating in this course, students should be able to <ul style="list-style-type: none"> <li>• independently recognize the task domain at hand for new applications</li> <li>• select a suitable and promising machine learning methodology based on their known theoretical properties</li> <li>• apply the chosen methodology to the given problem using Python</li> </ul>
7	<b>Prerequisites</b>	None

4	<b>Module coordinator</b>	Prof. Dr. Bernhard Kainz
5	<b>Contents</b>	<p>This module provides an introduction to computer science and programming, covering fundamental concepts and techniques. Students will develop a solid foundation in computer programming using the Python programming language. The module aims to foster independent learning and effective collaborative programming through practical work and problem-solving activities.</p> <p><b>Week 1: Motivation and Logistics, Introduction to Computers</b>  - This session sets the stage by discussing the motivation behind studying computer science and covers the logistics of the module.</p> <p><b>Week 2: Data Representation, Boolean Algebra, and Python Basics</b>  - Topics include data representation in computers, Boolean algebra, and an introduction to Python programming language. Students will learn about organization and basic operations in Python.</p> <p><b>Week 3: Memory Organization, Branching, and Control Statements</b>  - This week focuses on memory organization, branching, and control statements. Students will explore different number representations and continue learning about Boolean algebra. They will also delve into control statements, specifically if-else statements.</p> <p><b>Week 4: Decomposition, Functions, and Control Statements (Loops)</b>  - Students will learn about decomposition, abstraction, and functions. The session will cover topics such as tuples, lists, recursion, and dictionaries. Additionally, control statements related to loops will be discussed, and students will submit their solutions for mathematical operation questions.</p> <p><b>Week 5: Testing, Debugging, Exceptions, and Object-Oriented Programming</b>  - This week emphasizes the importance of testing, debugging, and handling exceptions. Students will gain an understanding of object-oriented programming concepts and how to implement them in Python. They will also explore advanced Python data types and submit their solutions for control statements (if-else) questions.</p>

#### **Week 6: Classes, Inheritance, Program Efficiency, and Debugging**

- The session focuses on classes, inheritance, and program efficiency. Students will deepen their knowledge of recursion and learn about debugging techniques, including the use of try-except statements. They will submit solutions for debugging and try-except statements questions.

#### **Week 7: Program Efficiency, Searching, and Sorting**

- Topics covered include program efficiency optimization, searching algorithms, and sorting algorithms. Students will continue their exploration of object-oriented programming and submit their solutions for recursion questions.

#### **Week 8: Version Management with Git and Object-Oriented Programming**

- This week introduces version management using Git and emphasizes its importance in collaborative programming projects. Students will further enhance their understanding of object-oriented programming and submit their solutions for advanced Python data types questions.

#### **Week 9: Trees and Searching**

- The focus of this week is on trees, their representation, and searching algorithms. Students will also submit their solutions for searching and sorting questions.

#### **Week 10: Graphs, Dijkstra's Algorithm, and Graph Algorithms**

- Students will learn about graphs, graph algorithms, and specifically Dijkstra's algorithm for finding the shortest path in a graph. They will submit their solutions for Dijkstra's algorithm questions.

#### **Week 11: Hashtables**

- This session introduces hashtables as a data structure for efficient searching and retrieval. Students will gain practical knowledge of implementing hashtables.

#### **Week 12: Revision and Q&A**

- This week is dedicated to revising the covered topics and addressing any questions or concerns students may have.

#### **Learning Goals and Competencies:**

- Independent organization and coordination of own work
- Problem-solving and solution development in theoretical and programming tasks
- Quality assurance of submitted solutions
- Responsibility and evaluation of own work

By the end of this module, students will have a solid foundation in computer science, programming principles, and collaborative

		programming skills necessary for further studies and practical application of computer science concepts.
6	<b>Learning objectives and skills</b>	<p>1. Understanding Computer Science and Programming Basics:</p> <ul style="list-style-type: none"> <li>- Acquire fundamental knowledge about computer science and programming.</li> <li>- Understand the motivation and logistics behind studying computer science.</li> <li>- Gain a preliminary understanding of computers and their components.</li> </ul> <p>2. Proficiency in Python Programming Language:</p> <ul style="list-style-type: none"> <li>- Learn basic operations and organization in Python.</li> <li>- Comprehend and implement different data types in Python such as tuples, lists, dictionaries, etc.</li> <li>- Develop proficiency in control statements, branching, loops, and functions.</li> <li>- Understand and apply principles of object-oriented programming, classes, and inheritance in Python.</li> <li>- Learn about error handling and debugging in Python.</li> </ul> <p>3. Learning about Memory Organization:</p> <ul style="list-style-type: none"> <li>- Understand how data is represented in computers.</li> <li>- Learn about memory organization, Boolean algebra, and different number representations.</li> </ul> <p>4. Developing Problem-Solving Skills:</p> <ul style="list-style-type: none"> <li>- Solve mathematical problems using programming concepts.</li> <li>- Apply programming concepts to solve practical problems.</li> <li>- Learn how to search, sort, and apply algorithms to solve complex problems.</li> <li>- Implement searching algorithms in different data structures like trees, graphs, and hash tables.</li> </ul> <p>5. Understanding and Implementing Version Control using Git:</p> <ul style="list-style-type: none"> <li>- Understand the importance of version management in collaborative programming projects.</li> <li>- Learn how to use Git for version management.</li> </ul> <p>6. Mastering Debugging Techniques and Exception Handling:</p> <ul style="list-style-type: none"> <li>- Understand the importance of testing and debugging.</li> <li>- Learn about different debugging techniques and how to handle exceptions using try-except statements in Python.</li> </ul> <p>7. Developing Independent Learning and Collaborative Programming Skills:</p> <ul style="list-style-type: none"> <li>- Cultivate the ability to organize and coordinate personal work independently.</li> <li>- Enhance problem-solving skills and solution development in theoretical and programming tasks.</li> </ul>

		<ul style="list-style-type: none"> <li>- Learn to assure the quality of submitted solutions and evaluate personal work.</li> <li>- Understand how to work in a collaborative programming environment.</li> </ul> <p>8. Familiarity with Different Data Structures and Algorithms:</p> <ul style="list-style-type: none"> <li>- Learn about data structures like trees, graphs, and hashtables.</li> <li>- Understand different searching algorithms and sorting algorithms.</li> <li>- Learn about Dijkstra's algorithm for finding the shortest path in a graph.</li> </ul> <p>9. Understanding Program Efficiency:</p> <ul style="list-style-type: none"> <li>- Gain knowledge about program efficiency and its optimization.</li> <li>- Learn about the application of recursion in improving program efficiency.</li> </ul>

5	<b>Contents</b>	<p>Die Vorlesung ist an alle ingenieurwissenschaftliche Studiengänge und Studierenden mit Interesse an einer Tätigkeit in der Automobilindustrie oder deren Umfeld gerichtet. Es werden die Themen der Produktentstehung bis zur Fertigung und Vertrieb beleuchtet. Dabei wird der Aspekt des interdisziplinären Agierens aus unterschiedlichen Blickwinkeln dargestellt.</p> <p>Zum einen werden Einblicke in die technische, konstruktive Umsetzung von wesentlichen Elementen eines Automobils gestreift, zum anderen sollen aber auch strategische und betriebswirtschaftlich bestimmende Größen vermittelt und deren Bedeutung für den Ingenieur vertieft werden. Ziel ist es ein Gesamtverständnis für den Komplex der Automobilindustrie zu vermitteln.</p> <p>Das Automobil ist zunehmend eines der komplexesten Industriegüter. Es ist geprägt durch gesellschaftliche Anforderungen, gesetzliche Restriktionen und unterschiedlichste Markt- und Kundenwünschen weltweit.</p> <p>Lernen Sie die Herausforderungen für die Ingenieurwissenschaften in der Automobilindustrie kennen, die Zusammenhänge verstehen und die Lösungen zu erarbeiten.</p> <p>Folgende thematischen Schwerpunkte werden in der Vorlesung behandelt:</p> <ul style="list-style-type: none"> <li>• Überblick über die Abläufe und Rahmenbedingungen für die Entwicklung in der Automobilindustrie.</li> <li>• Die Produktentstehung</li> <li>• Der Produktionsprozess in der Automobilindustrie</li> <li>• Integrierte Absicherung</li> <li>• Handelsorganisation: Markteinführung, Marketingkonzepte, Service und Aftermarket Strategien</li> <li>• Elektrifizierung, Hybrid, alternative Antriebe</li> <li>• Elektronik im Fahrzeug: Fahrerassistenz, Navigation, Kommunikation</li> <li>• Neue Technologien für die Herstellung von Karosserien</li> <li>• Passive und aktive Sicherheit. Trend und Markttendenzen, technische Lösungen</li> <li>• Entwicklung der Fahrdynamik</li> <li>• IT-Systeme in der Automobilindustrie</li> <li>• Spitzenleistungen als faszinierende Herausforderungen (Designstudien, Experimentalfahrzeuge, Rennsport)</li> <li>• Qualitätsmanagement</li> </ul>

6	<b>Learning objectives and skills</b>	Nach besuch der Vorlesung sind die Studierenden in der Lage: <ul style="list-style-type: none"> <li>• Einen Überblick über die Produktentstehung bin hin zur Serienentwicklung zu geben</li> <li>• Die Produktionsprozesse im Automobilbau zu verstehen</li> <li>• Supportprozesse wie die integrierte Absicherung zu verstehen</li> <li>• Die Vor- und Nachteile der unterschiedlichen Antriebstechnologien zu nennen</li> <li>• Einen Überblick von Elektrik und Elektronik im Fahrzeug zu haben</li> <li>• Einflüsse auf die Fahrzeugdynamik zu verstehen</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Wolfgang Heiß
5	<b>Contents</b>	<p>*Elektronenmikroskopie:*  Die Vorlesung gibt eine Einführung in die Grundlagen der Raster- und Transmissionselektronenmikroskopie und hat zum Ziel, den Teilnehmern die weitreichenden Möglichkeiten der Mikroskopie mit schnellen Elektronen für die Strukturuntersuchung von Materialien aufzuzeigen. Im Rahmen der Vorlesung und den vertiefenden Übungen soll ein fundiertes Verständnis für die Wechselwirkung von schnellen Elektronen mit Materie und die daraus resultierenden Kontrastphänomene in elektronenmikroskopischen Abbildungen und Beugungsbildern erarbeitet werden, das Grundvoraussetzung für eine korrekte Interpretation elektronenmikroskopischer Ergebnisse sowie die Nutzung elektronenmikroskopischer Verfahren in eigenen Forschungsarbeiten darstellt. Im Bereich der Transmissionselektronenmikroskopie (TEM), die den Schwerpunkt der Vorlesung bildet, werden neben der Elektronenbeugung vornehmlich die Verfahren der sog. konventionellen TEM behandelt. Hochauflösende Transmissionselektronenmikroskopie (HRTEM) sowie die wichtigsten analytische Verfahren (EDX, EELS) werden in einem nachfolgenden zweiten Teil der Vorlesung (EM II) besprochen.</p> <p>*Nanospektroskopie:* - Die Vorlesung gibt einen Überblick über optische Spektroskopie-Methoden die allgemein für Halbleiterstrukturen und im Speziellen für Nanostrukturen verwendet werden. Im Besonderen wird auf drei Themen eingegangen: Nanocharakterisierung über photothermisch induzierte Resonanz, Nanospektroskopie mit Röntgenstrahlung und Nanospektroskopie über Plasmonen Verstärkung. Gegebenenfalls wird auch Nanoskopie = Mikroskopie mit Auflösung unter dem Beugungslimit vorgestellt. Neben diesen Nanospektroskopie spezifischen Themen werden auch Grundlagen über Wechselwirkung zwischen Licht und Materie oder auch grundlegende Beschreibungen von Licht besprochen.</p> <p>*Rastersondenmikroskopie:* Experimenteller Aufbau (Rastersondenmikroskop und Sonden) - Rasterkraftmikroskopie (Betriebsmodi)- Rastertunnelmikroskopie (Tunneleffekt und Betriebsprinzip) - Bilddatenverarbeitung</p>

		*Nanoindentierung:* Grundlagen der Härteprüfung - Experimenteller Aufbau eines Nanoindenters - Grundlagen der Kontaktmechanik (Sneddon, Hertz) - Oliver-Pharr Auswertemethode - Fortgeschrittene Methoden zur Bestimmung lokaler mechanischer Eigenschaften (Dehnrateabhängigkeit, Fließspannung, theoretische Festigkeit, Dynamische Charakterisierung)
6	<b>Learning objectives and skills</b>	<p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• kennen mikroskopische Verfahren zur Untersuchung von Materialien auf kleinen Längenskalen</li> <li>• verstehen die vielfältigen Verfahren der Elektronenmikroskopie und deren Anwendung in den Material- und Nanowissenschaften</li> <li>• haben fundierte Kenntnisse über den Einsatz von Rastersondenverfahren</li> <li>• kennen die verschiedenen Methoden der Nanoindentierung und deren Einsatz zur lokalen Untersuchung von mechanischen Materialeigenschaften</li> <li>• verstehen die Einsatzmöglichkeiten hochauflöster mikroskopischer Verfahren zur Untersuchung von Nanomaterialien</li> <li>• verstehen vertiefte Zusammenhänge zwischen der chemischen Zusammensetzung, der Struktur und den Eigenschaften von Werkstoffen</li> <li>• haben fundierter Kenntnisse über die Grundlagen zum Aufbau der verschiedenen Werkstoffklassen</li> <li>• kennen fortgeschrittene Methoden zur lokalen mechanischen Eigenschaft von Werkstoffen</li> <li>• kennen und verstehen grundlegende Konzepte zur Beschreibung von Licht</li> <li>• verstehen grundsätzliche Wechselwirkungen zwischen Materie und Licht</li> <li>• verstehen die besonderen optischen Eigenschaften von Halbleiter-Nanomaterialien</li> <li>• kennen die Grundzüge der Plasmonik</li> <li>• kennen optische Meßmethoden für die spektroskopische Charakterisierung einzelner Nanostrukturen</li> <li>• haben einen Überblick über höchstauflösende optische Mikroskopie</li> <li>• haben einen Überblick über Anwendungen von optisch relevanten Nanomaterialien</li> </ul>

3	Lecturers	Dr. Michael Wurmshuber	

4	<b>Module coordinator</b>	apl. Prof. Dr. Heinz Werner Höppel
5	<b>Contents</b>	<p>Ziel dieses Praktikums ist es, das erlernte Wissen aus den früheren Mastervorlesungen der Module M1, M4 und M6 sowie aus dem vorausgegangenen Bachelorstudium in praktischen Versuchen zu vertiefen. Das Praktikum orientiert sich an die Herstellung und Charakterisierung von nanostrukturierten Werkstoffen. Dazu zählen Dünnsschichten, Nanopartikeln und ultrafeinkörnige Werkstoffe die durch top-down und bottom-up Verfahren hergestellt werden. Die Charakterisierung erfolgt mittels Indentierung, TEM, REM, UV-Vis und XRD.</p> <p>Im Einzelnen werden derzeit zwei Versuchsreihen angeboten:</p> <ul style="list-style-type: none"> <li>• Synthese von Nanopartikeln mit verschiedenen Größen</li> <li>• Spektroskopische Untersuchung von Nanopartikeln</li> <li>• Transmissionselektronenmikroskopie von Nanopartikeln</li> <li>• Herstellung und Charakterisierung von CVD-Diamantschichten sowie</li> <li>• Herstellung und Charakterisierung von PED-Ni</li> <li>• Erzeugung und Eigenschaften von ultrafeinkörnigen Blechwerkstoffen</li> <li>• Mikrostrukturcharakterisierung mittels TEM</li> <li>• Herstellung und Charakterisierung von CVD-Diamantschichten</li> </ul> <p>Aufgrund der begrenzten Kapazität einzelner Versuche können nicht alle Einteilungswünsche garantiert werden. Es besteht Anwesenheitspflicht bei den Versuchen. Bei jedem Versuch müssen ein Vor- (ehem. Antestat) und Nach-Protokoll (ehem. Protokoll) erfolgreich geleistet werden, was durch Unterschriften der jeweiligen Betreuer auf der Testatkarte bestätigt wird. Das Modul gilt als bestanden, wenn die vollständig ausgefüllte Testatkarte bis zum Beginn des nächstfolgenden Vorlesungszeitraums im Sekretariat des Modulverantwortlichens abgegeben wird.</p>
6	<b>Learning objectives and skills</b>	<p>Die Studierenden anwenden:</p> <p>Die Studierenden wenden bei diesem Praktikum das in den VLs erlernte Wissen zur Herstellung und Charakterisierung von nanostrukturierten Werkstoffen an.</p> <p>analysieren und bewerten:</p> <p>Die erzeugten Messwerte werden in Kleingruppen analysiert und bewertet. In Fokus steht dabei auch, werkstoffübergreifende Eigenschaften und Methoden zu vermitteln.</p>

## **Nanotechnology of Disperse Systems (Prof. Klupp Taylor, Dr. Distaso, Winter and Summer Semester, 3+1 ECTS)**

- Identify major applications and research fields of nanodisperse systems
- Identify and explain the fundamental theories of nucleation and growth and colloidal stability
- Differentiate between different approaches for the preparation of nanodisperse systems
- Select metal and metal oxide precursors and oxidizing/reducing agents according to their thermodynamic properties.
- Give examples of means to control nanoparticle size, shape and agglomeration state
- Distinguish between different characterization tools according to their advantages and disadvantages for the analysis of nanodisperse systems
- Identify the influence of particle size on key physical properties
- Match physical properties of nanoparticles to current or emergent applications
- Plan a presentation in which they compare and appraise recent research activities from the literature

## **Self-organization on Surfaces (Prof. Halik, Winter Semester Only, 3 ECTS)**

5	Contents	In preparation for the master's thesis, the students carry out independent literature research on a relevant topic in the field of nanotechnology. Supervision is organized in the respective chairs. The lecturers issue topics on which the students have to present their research results in writing. Furthermore, the students prepare a lecture in English on the topic. After the lecture (approx. 30 minutes), the speaker will answer questions in a discussion round	
		-----  Die Studierenden erarbeiten zur Vorbereitung der Masterarbeit eine eigenständige Literaturrecherche in einem relevanten Thema im Bereich der Nanotechnologie. Die Betreuung wird in den jeweiligen Lehrstühlen organisiert. Von den Dozenten werden Themen ausgegeben, zu welchen die Studierenden ihre Rechercheergebnisse in schriftlicher Form darstellen müssen.	

		<p>Weiterhin erarbeiten die Studierenden zu dem Thema einen Vortrag in englischer Sprache.</p> <p>Im Anschluss an den Vortrag (ca. 30 Minuten) steht der Vortragende Rede und Antwort in einer Diskussionsrunde.</p>
6	<b>Learning objectives and skills</b>	<p>Students are able:</p> <ul style="list-style-type: none"> <li>• explain scientific basics as well as specialized and in-depth knowledge.</li> <li>• independently design, reflect and methodically expand their own learning processes,</li> <li>• work independently on literature research for a specific topic in the field of nanotechnology,</li> <li>• summarize and discuss this topic in writing.</li> <li>• give a free lecture on a piece of knowledge compiled from the literature</li> <li>• Apply subject-related basics, terms and formulations in English</li> </ul> <hr/> <p>Die Studierenden können:</p> <ul style="list-style-type: none"> <li>• wissenschaftliche Grundlagen sowie spezialisiertes und vertieftes Fachwissen erläutern.</li> <li>• eigene Lernprozesse selbständig gestalten, reflektieren und methodisch erweitern,</li> <li>• eine Literaturrecherche für ein eingegrenztes Thema im Bereich der Nanotechnologie selbständig bearbeiten, zusammenfassen und dieses Thema in schriftlicher Form diskutieren.</li> <li>• einen freien Vortrag zu einem aus der Literatur erarbeiteten Wissensstoffs halten</li> <li>• fachbezogene Grundlagen, Begriffe und Formulierungsweisen in Englischer Sprache anwenden</li> </ul>
7	<b>Prerequisites</b>	None

4	<b>Module coordinator</b>	Frederik Leikauf
5	<b>Contents</b>	<p><b>Präsentationstechnik</b>  In diesem Modul erwerben die Studierenden im ersten Teil zunächst grundlegende Fähigkeiten und Kenntnisse zum wissenschaftlichen Arbeiten. Sie lernen dann im Anschluss, wie sie effektive Präsentationen vorbereiten und gestalten können, wobei Schwerpunkte auf der Entwicklung von Präsentationsfähigkeiten wie Körpersprache und Rhetorik aber auch auf der Foliengestaltung liegen.</p> <p>Darüber hinaus erhalten die Studierenden noch praktische Übungen zur Stimmbildung</p> <p>In diesem Seminar werden an Hand von Vorträgen, die von Studierenden auszuarbeiten und in englischer Sprache vorzutragen sind, die neusten Entwicklungen aus dem Gebiet der Werkstoffwissenschaften vorgestellt. Die Literatur zu einem Thema ist selbstständig zu suchen oder wird vom Betreuer ausgegeben. Im Anschluss an den Vortrag (20 Minuten) steht der Vortragende Rede und Antwort in einer Diskussionsrunde (5 Minuten).</p> <p><b>Exkursionen</b>  In den Exkursionen werden verschiedene Aspekte der industriellen Umgebung im Bereich der Werkstofftechnologie oder Nanotechnologie kennengelernt.</p> <p>.....</p> <p><b>Presentation Technique</b>  In this module, students first acquire basic skills and knowledge of scientific work. They then learn how to prepare and design effective presentations, focusing on the development of presentation skills such as body language and rhetoric, but also on slide design.</p> <p>In addition, the students will receive practical exercises in voice training.</p>

	<p>In this seminar, the latest developments in the field of materials science are presented by means of lectures to be prepared by students and presented in English. The literature on a topic has to be searched independently or will be handed out by the supervisor. Following the lecture (20 minutes), the lecturer will be available to answer questions in a discussion session (5 minutes).</p> <p><b>Excursions</b></p> <p>In the excursions different aspects of the industrial environment in the field of materials technology or nanotechnology are learned.</p>
6	<p>Die Studierenden werden befähigt, wissenschaftliche Informationen klar und überzeugend zu kommunizieren und sind am Ende des Moduls in der Lage, selbstbewusst und kompetent vor anderen zu präsentieren.</p> <p>Dafür erarbeiten die Studierenden selbstständig ein wissenschaftliches Referat in englischer Sprache zu einem vorgegebenen Thema. Sie erwerben Erfahrungen im möglichst freien Vortrag eines aus der Literatur erarbeiteten Wissensstoffs.</p> <p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• können selbstständig aktuelle wissenschaftliche Ergebnisse und Erkenntnisse in einer Thematik des Masterstudiums (im Bereich der Materialwissenschaft oder im Bereich der Nanotechnologie) präsentieren und in der Gruppe diskutieren;</li> <li>• können freie Vorträge über aus der Literatur erarbeiteten Wissensstoff halten;</li> <li>• stärken ihre Selbst- und Sozialkompetenz, indem einerseits ein Fachthema für ein Fachpublikum auf Masterniveau aufbereitet, dargestellt und zielgruppenadäquat präsentiert wird und andererseits in einer Gruppe gemeinsam und unter Anleitung fachnahe Anwendungen sowie Realisierungsmöglichkeiten diskutiert werden;</li> <li>• schärfen durch die Wahlfreiheit der Exkursionen ihr Profil im Hinblick auf ihr angestrebtes zukünftiges Berufsfeld und/oder ihre Persönlichkeit</li> </ul> <p>.....</p> <p>Students will be enabled to communicate scientific information clearly and convincingly and will be able to present confidently and competently in front of others at the end of the module.</p> <p>For this purpose, students independently develop a scientific presentation in English on a given topic. They will gain experience in giving as free a presentation as possible of a body of knowledge acquired from the literature.</p> <p><b>The students</b></p>

		<ul style="list-style-type: none"> <li>can independently present current scientific results and findings in a topic of the Master's program (in the field of materials science or in the field of nanotechnology) and discuss them in the group;</li> <li>can give free lectures on knowledge material acquired from the literature;</li> <li>strengthen their self- and social competence by preparing, presenting and presenting a specialized topic for a specialized audience at Master's level in a way appropriate to the target group on the one hand, and by discussing specialized applications as well as realization possibilities in a group together and under guidance on the other hand;</li> <li>sharpen their profile with regard to their desired future professional field and/or their personality through the freedom of choice of the excursions.</li> </ul>

5	<b>Contents</b>	<p><b>Structural analysis of functional ceramics using advanced diffraction techniques</b></p> <p>This course will cover basic crystallography, advanced diffraction techniques (e.g., x-ray, neutron and electron) including instrumentation, strategies to collect diffraction data (ex situ and in situ) and different data analysis methods. The course has been designed in such a way that, in addition to the development of theoretical background, students can have hands-on experience with different data analysis methods and software. At the initial stage we will cover basics of crystallography and principle of diffraction technique. An in-depth discussion on different (e.g., x-ray, 2D x-ray, neutron and electron) diffraction techniques and their use in the field of materials science and engineering will then be presented. In the next step we will discuss ferroelectric/ferroelastic materials and how diffraction technique can be used to investigate microscopic origin of macroscopic functional properties.</p> <p><b>Exercises for functional ceramics II: Structural Analysis</b></p> <p>Students will learn how to extract various structural parameters using different data analysis (e.g. Selected peak-fitting, Le Bail fitting and Rietveld structural refinement) techniques and how these structural parameters can be correlated with different macroscopic properties. A brief overview of the recent developments and future scopes in the field of structural analysis (e.g., 3D- XRD, diffuse scattering) using diffraction technique will be highlighted to conclude the course</p>
6	<b>Learning objectives and skills</b>	<p><b>The students</b></p> <ul style="list-style-type: none"> <li>• know the necessary scientific and practical knowledge for the microstructural characterization of ceramics using diffraction methods.</li> <li>• have an in-depth understanding of the following properties of ceramics: electrical, thermal and mechanical properties</li> <li>• understand the influences of structure and microstructure on electromechanical properties</li> <li>• know and understand how diffraction techniques work and what basic models are available for analysis</li> <li>• can use the appropriate software.</li> </ul>

5	<b>Contents</b>	Mechanical Properties and Fracture of Ceramics    • ◦ Das Laborpraktikum vermittelt praktische Erfahrungen in der makroskopischen mechanischen Charakterisierung von keramischen Werkstoffen, wobei speziell linear elastische und ferroelastische Werkstoffe untersucht werden. *English*  Mechanical Properties and Fracture of Ceramics   This course will introduce participants to the origins of the mechanical behavior of ceramic materials through discussions of atomic structure and microstructure. Here, participants will be introduced to linear elastic fracture mechanics and some concepts related to nonlinear fracture mechanics. Then, various toughness mechanisms will be presented and discussed, including phase transformation, ferroelasticity, and crack bridging. In the final section of the lecture, fractographic techniques for the analysis of fracture surfaces as well as subcritical crack growth will be presented.  Exercise for Functional Ceramics III: Mechanical Properties   This laboratory practical course provides hands-on experience in the macroscopic mechanical characterization of ceramic materials, specifically studying linear elastic and ferroelastic materials.
6	<b>Learning objectives and skills</b>	Die Studierenden <ul style="list-style-type: none"><li>• lernen die Ursprünge der mechanischen Eigenschaften von Keramiken kennen</li><li>• verstehen, wie sich keramische Werkstoffe nichtlinear, hysteretisch oder plastisch verformen können und wie dies das Bruchverhalten beeinflussen kann</li><li>• erlernen der Grundlagen der linear-elastischen Bruchmechanik, insbesondere der Hintergründe der Energiefreisetzungsraten und des Spannungsintensitätsfaktors</li><li>• verstehen Bruchflächen zur Analyse der Bruchentstehung genutzt werden können</li><li>• verstehen, wo Risse unterkritisch wachsen können und können diese charakterisieren</li></ul> *English* The students

		<ul style="list-style-type: none"> <li>• learn the origins of the mechanical properties of ceramics</li> <li>• understand how ceramic materials can deform nonlinearly, hysteretically, or plastically and how this can affect fracture behavior</li> <li>• learn the fundamentals of linear elastic fracture mechanics, especially the background of the energy release rate and stress intensity factor</li> <li>• understand fracture surfaces can be used to analyze fracture initiation</li> <li>• understand where cracks can grow subcritically and be able to characterize them</li> </ul>

5	<b>Contents</b>	<p>Glass formulation using project management:            Intensive exercise of 6 half days at the end of the semester.            The teaching follows an "on time approach. After presentation of the case study, an introduction to the project management is given. Analytical tools are given to the students than can use them directly on the case study. The project is then defined through brainstorming followed by Solution analysis and quotation. The rules for scheduling, monitoring and controlling a project are introduced before the case study is started to be solved. An emphasis is given on reporting by quick presentation at the end of each half day by the project team. In conclusion a last time is taken to analyze the personal issues encounter during these six half days. That help the students to have a pragmatic thinking about what could have been a better project team and the need of a leader.</p> <p>Glass and Ceramic for Energy-technology:</p> <ul style="list-style-type: none"> <li>• Materials and energy</li> <li>• Solar Energy</li> <li>• Solar Thermal</li> <li>• Photovoltaic Energy</li> <li>• Insulation</li> <li>• Wind Energy</li> <li>• Nuclear waste glass storage</li> <li>• Energy in glass processing</li> <li>• Fuel Cell and Ion conductivity</li> <li>• Lighting LED and LASER REE technology</li> </ul>

2	Courses / lectures	Vorlesung: Advanced Corrosion Science (2.0 SWS, WiSe 2024)  Vorlesung: Basics Electrochemistry I (2.0 SWS, WiSe 2024)  Vorlesung: Basics Electrochemistry II (2.0 SWS, SoSe 2025)  Übung: Berechnung von Korrosionsproblemen (2.0 SWS, WiSe 2024)  Vorlesung: Surface Modification techniques (2.0 SWS, SoSe 2025)	3 ECTS  3 ECTS  3 ECTS  1 ECTS  3 ECTS
3	Lecturers	Michael Strebl Prof. Dr. Sannakaisa Virtanen Dr. Alexander Tesler Prof. Dr. Patrik Schmuki Michael Höhlinger	

4	<b>Module coordinator</b>	Prof. Dr. Sannakaisa Virtanen
5	<b>Contents</b>	<p>*Advanced Corrosion Science*</p> <p>Recap of fundamental background in electrochemistry and corrosion</p> <p>Introduction to advanced methods in corrosion science:</p> <p>Electrochemical methods (Polarization curve, EIS, EC noise)</p> <p>Local techniques (SVET, SKP, SIET, LEIS)</p> <p>Non electrochemical techniques: Respirometry, mass loss, solution analysis, resistance method</p> <p>Surface analysis (SEM, TEM, EDX, XPS, Auger, ToF SIMS, GDOES, atom probe analysis)</p> <p>Discussion of current issues in corrosion science:</p> <p>Biodegradable metals</p> <p>Passive films und localized corrosion</p> <p>Atmospheric corrosion</p> <p>Corrosion in nuclear waste repositories</p> <p>Corrosion of advanced materials: AM, BMG, high entropy alloys und ultrafine-grained materials</p> <p>Drinking water corrosion, microbially induced corrosion, cathodic protection</p> <p>Inhibitors und smart coatings</p> <p>Mg und Al corrosion</p> <p>Corrosion Modelling, DFT</p> <p>(Corrosion in) Electrochemical energy storage and conversion</p> <p>Corrosion failure case studies and analysis: Discussion of the conditions and mechanisms that led to corrosion failure based on observations and experimental evidence and derivation of a solution to the problem.</p> <p>*Surface Modification Techniques*</p>

Innerhalb der Materialwissenschaften kommt der Oberflächenmodifikation entscheidende Bedeutung zu. Neben der Verbesserung der Korrosionsbeständigkeit sowie der tribologischen Eigenschaften können dadurch auch gänzlich neue Eigenschaften generiert werden. Im Zuge dieser Lehrveranstaltung werden diverse Methoden der Oberflächenmodifikation und Oberflächenfunktionalisierung beleuchtet. Es werden die Grundlagen aber auch Fallbeispiele derartiger Verfahren erläutert und deren Rolle im Alltäglichen Leben ebenso wie in industriellen Anwendungen Rechnung getragen. Neben den etablierten Methoden werden auch neuartige Ansätze aus den aktuellen Forschungsgebieten des Lehrstuhls erläutert. The tailored modification of surfaces plays an important role in material science. Besides improving e.g. the corrosion- and tribological-properties of material-surfaces by specific methods and approaches, furthermore completely new properties can be achieved. In this course common methods of surface modification and surface functionalization are elucidated. The theoretical background and examples, indicating the relevance of these methods in everyday life as well as for industrial applications, are presented. In addition to the common methods new highly promising approaches are introduced and discussed.

#### \*Berechnung von Korrosionsproblemen\*

Die World Corrosion Organization (WCO) schätzte 2009 die wirtschaftlichen Schäden durch Korrosion auf weltweit 1,8 Billionen US-Dollar. In Industriestaaten belaufen sich die jährlichen Kosten durch Korrosion auf bis zu 4 Prozent des Bruttoinlandsproduktes, in Deutschland also auf bis zu 104 Milliarden Euro" [Deutsches Lackinstitut]. Die hier angeführten Zahlen zeigen, dass Korrosion ein wirtschaftlich sehr bedeutendes Problem darstellt, dem große Beachtung beigemessen werden muss. Das Lernziel der Vorlesung "Berechnung von Korrosionsproblemen" ist es, mittels im Bachelorstudium erworbenen Kenntnissen, Fallbeispiele typischer Korrosionsprobleme fachlich tiefgehend verstehen und beurteilen zu können. Hierfür werden zum einen häufige grundlegende praxisnahe Probleme definiert und beschrieben.

Zum anderen werden durch Abstraktion komplexe Beispiele und Anwendungen auf bekannte Grundlagen heruntergebrochen, quantitativ beschrieben und somit fassbar gemacht.

#### \*Basics Electrochemistry\*

Der Elektrochemie kommt große Bedeutung sowohl im wissenschaftlichen als auch technologischen Kontext zu. Heutige Forschungsarbeiten konzentrieren sich hauptsächlich (aber nicht ausschließlich) auf die Themengebiete Nanotechnologie und Anwendungen der Energietechnik wie Brennstoffzellen, Batteriesysteme und Solarzellen. Prinzipiell widmet sich die Elektrochemie dem Zusammenspiel von Elektrizität und chemischen Reaktionenabläufen in der Art, dass freie chemische Energie, die mit einer Reaktion einhergeht, in elektrische Energie konvertiert wird (z.B. Brennstoffzellen) oder aber elektrische Energie Verwendung findet um beispielsweise

	<p>stabile Verbindungen zu zersetzen (z.B. Chlorgaserzeugung). Die Lehrveranstaltung leitet die Studierenden an, die Grundlagen der Elektrochemie zu verstehen und erläutert grundlegende Methoden und Arbeitsweisen um elektrochemische Reaktionen und darauf basierende Anwendungen zu verstehen.</p> <p>Electrochemistry plays an important role in scientific and technological fields. Nowadays, the research areas are focused, but not limited, on nanotechnology and energy devices, i.e. fuel cells, battery systems and solar cells. In principle, the electrochemistry involves the study of relationship between electricity and chemical reactions, such that chemical free energy associated with a reaction is converted into electrical energy (e.g. fuel cells) or conversely, electricity is used to decompose stable chemical systems (e.g. production of chlorine). The lecture program provides an opportunity for students to understand the basics of electrochemistry and provide the fundamental tools for understanding electrochemical-reactions and electrochemical-devices.</p>
6	<p><b>*Advanced Corrosion Science*</b></p> <p><b>The students are able to:</b></p> <ul style="list-style-type: none"> <li>• Identify, distinguish, and explain corrosion mechanism and different forms of corrosion.</li> <li>• Illustrate and explain electrochemical, local, non-electrochemical and surface analysis methods that are used in corrosion science.</li> <li>• Interpret results of the characterisation methods described above</li> <li>• Explain the different concepts of smart coatings and self-healing coatings including triggers and release mechanisms of inhibitors.</li> <li>• Present the details that play a role atmospheric corrosion processes like salts, relative humidity, electrolyte film thickness, time of wetness, influence of gases, wet dry cycling and corrosion product formation.</li> <li>• Explain different test methods for atmospheric corrosion, like lab exposure, accelerated corrosion tests and field exposure tests.</li> <li>• Discuss special features in the corrosion mechanisms of Mg and Al alloys (anomalous H<sub>2</sub> evolution).</li> <li>• Review different mechanisms of localized corrosion and explain the significance of pit initiation and pit growth, critical pitting potential, critical pitting temperature and repassivation in localized corrosion.</li> <li>• Explain cathodic and anodic paint disbonding or delamination and how it can be studied using SKP.</li> <li>• Assess findings of scientific investigations of corrosion failure, determine corrosion mechanisms that lead to the corrosion issue and develop a concept for solving the corrosion problem.</li> <li>• Explain mechanisms of different types of corrosion inhibitors.</li> </ul>

- Summarize corrosion properties of advanced materials like high entropy alloys, bulk metallic glasses, additive manufactured materials or ultrafine-grained materials.
- Describe corrosion related aspects of nuclear waste storage and the influence of radiation on corrosion.
- Compare different types of metals in their applicability as a biodegradable metal and explain surface treatments to control the degradation behavior.
- Understand the complexity of simulated body fluids and possible discrepancy between in vitro and in vivo experiments.
- Describe mechanisms of microbially induced corrosion, dezincification.
- Explain cathodic protection strategies by sacrificial anodes and impressed current cathodic protection.

### **\*Surface Modification Techniques\***

#### **Die Studierenden**

- können die Grundlagen von Korrosionsmechanismen und -arten wiedergeben.
- lernen verschiedene Methoden der Oberflächenvorbehandlung kennen.
- können abschätzen, welche Oberflächenvorbehandlung für die Entfernung verschiedener Verunreinigungen eingesetzt werden können.
- können den zugrundeliegenden Mechanismus einer Konversionsbeschichtung am Beispiel der Phosphatierung und Chromatierung beschreiben.
- erklären die Mechanismen von elektrochemischer Abscheidung und elektrophoretischer Beschichtung
- erkennen den Zusammenhang verschiedener Schritte und Parameter der Oberflächenvorbereitung auf die finale Oberflächenqualität einer Beschichtung.
- lernen die Bestandteile und Wirkungsweise einer Reinigungslösung kennen
- Die Studierenden werden auf Besonderheiten hinsichtlich des Umweltschutzes bei der Oberflächentechnik sensibilisiert.
- Erklären die verschiedene Verfahren und Beschichtungsmechanismen von PVD und CVD Prozessen.
- Erklären von Verfahren des thermischen Spritzens und von Sol-Gel Beschichtungen
- können chemische und elektrochemische Konversionsschichten (Phosphatierung, Chromierung, Anodisierung)
- Erläutern Besonderheiten verschiedener organischer Beschichtungen (Lacke).
- Erklären selbstorganisierender Monolagen und Konzepte zur Erzeugung superhydrophober Oberflächen
- Beschreiben den Mechanismus der Ausbildung von selbstorganisierenden anodischen Oxidschichten (Nanoporen und Nanoröhren).

- Illustrating the mode of action of chemical mechanical pretreatment.
- Describing plasma aided methods, Laser and electron beam methods as well as ion implantation.
- Illustrating the mode of action of chemical conversion layers (phosphatization, chromating), electrodeposition, electrophoresis, electrochemical conversion layers (anodizing) and CVD/PVD techniques.
- Understanding the basics of organic coatings (paints and lacquers), self-assembled monolayers, self-organized anodic oxide layers (Nanopores, Nanotubes).

#### **\*Berechnung von Korrosionsproblemen\***

##### **Die Studierenden sind in der Lage:**

- den Wirkzusammenhang von Kinetik und Potential bei Korrosionsreaktionen quantitativ zu erfassen.
- Den Unterschied und die Einflüsse auf Diffusions- und Aktivierungskontrolle zu erklären
- Korrosionsvorgänge anhand schematischer Stromdichte-Potential Kurven zu veranschaulichen
- Pourbaix-Diagramme zu erstellen zu verstehen und anzuwenden.
- die Nernst Gleichung anzuwenden und leiten sie her.
- Fragestellungen der Hochtemperaturoxidation zu bewerten.
- Möglichkeiten des Korrosionsschutzes zu beurteilen.

Quantitative elucidation of the cause-effect relationship between kinetics and potential, Construction of Pourbaix diagrams, applying nernst equation, Assessment of high-temperature oxidation behaviors of metals and alloys, Evaluation of corrosion-protection approaches

#### **\*Basics Electrochemistry\***

##### **Die Studierenden**

- definieren und beherrschen rechnerisches Anwenden thermodynamischer Grundbegriffe und Modelle (Enthalpie, Entropie, Gibbs-Energie, chemische Gleichgewichte).
- vergleichen von Elektrolyten (Wässrige Lösungen, Organische Lösungen, Festphasenelektrolyte).
- vergleichen verschiedener Elektrodenarten und deren Elektrodenpotential.
- wenden die Nernst-Gleichung an.
- definieren elektrochemischer Systeme (Elektrolysezellen, Galvanische Zellen).
- verstehen Elektroden/Elektrolyt-Grenzflächen (elektrochemische Doppelschicht).
- können die Zusammenhanges von Reaktionsrate und Stromstärke diskutieren.

		<ul style="list-style-type: none"> <li>• bewerten die Kinetik von Elektrodenreaktionen (stofftrans portkontrolliert, ladungsdurchtrittskontrolliert, reaktionskontrolliert).</li> <li>• können die Butler-Volmer-Gleichung herleiten.</li> <li>• verstehen die theoretischen Grundlagen instrumenteller Techniken und technologischer Anwendungen (Brennstoffzellen, Batteriesysteme, elektrochemische Bauteile und Anwendungen).</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Defining and operating with fundamental thermodynamic concepts and models (enthalpy, entropy, free energy, chemical equilibrium).</li> <li>• Comparing of Electrolytes (aqueous solutions, organic solutions, solid phase electrolytes).</li> <li>• Comparing different types of electrodes and their electrode potential. Applying the Nernst equation.</li> <li>• Defining electrochemical systems (electrolytic cells and galvanic cells).</li> <li>• Elucidating Electrode-solution interfaces (electric double layer).</li> <li>• Discussing the relationship between electrochemical reaction rate and current.</li> <li>• Assessing electrode kinetics (mass transport control, charge transfer control, reaction control).</li> <li>• Deriving the Butler-Volmer equation.</li> <li>• Describing the theoretical background of instrumental techniques and technologies (fuel cells, battery systems, electrochemical devices).</li> </ul>
7	<b>Prerequisites</b>	Immatrikulation im MA-Studium
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Surface Science and Corrosion Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Oral mündliche Prüfung (30 Min.) oral exam (30 min.)

13	<b>Workload in clock hours</b>	Contact hours: 120 h Independent study: 180 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	Vorbereitende LiteraturWird im Zuge der Lehrveranstaltungen vorgestellt.

1	<b>Module name</b> 46235	<b>Praktikum zur Korrosion und Oberflächenanalyse</b> Laboratory course: Corrosion and surface analysis	<b>5 ECTS</b>
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr. Sannakaisa Virtanen
5	<b>Contents</b>	<p>Im Ergänzungsmodul Praktikum zur Korrosion und Oberflächenanalyse werden unter Anleitung von Betreuern im Rahmen eines Praktikums Versuche aus den Bereichen Korrosion und Oberflächentechnik abgehandelt. Das Modul besteht aus 4 einzelnen Versuchen. Die Studierenden erlernen im Zuge dieser Lehrveranstaltung neben dem selbstständigen Durchführen elektrochemischer Messungen, dem Anodisieren sowie der Charakterisierung der Hochtemperaturoxidationsbeständigkeit von Metallen und Legierungen, die Anwendung verschiedener Verfahren der Oberflächenanalyse. Neben diesen genannten methodischen Lernzielen wird fachliches Wissen über eine Auswahl besonders wichtiger Werkstoffe im Kontext der Korrosion und Oberflächentechnik vermittelt, wobei die Studierenden lernen Messergebnisse zu evaluieren und qualitative sowie quantitative Urteile über das Werkstoffverhalten zu fällen.</p> <p><b>English version</b></p> <p>Within the practical lab course students absolve experiments belonging to the field of Surface Science &amp; Electrochemistry &amp; Corrosion guided by experienced supervisors. The practical course is subdivided in 4 single experiments. The students learn the practical knowledge about conducting electrochemical measurements, anodization, and characterizing the high-temperature oxidation behavior of metals and alloys. Therefore a variety of surface-sensitive characterization techniques are introduced. Beside the latter methodical issues, furthermore expertise knowledge for a selection of especially important materials that are typically important in the context of corrosion and surface science is taught along the way. The students learn to evaluate measurement data and to interpret qualitative- and quantitatively the measured material behavior.</p>
6	<b>Learning objectives and skills</b>	<p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• bewerten den Einfluss von Legierungselementen und Beschichtungen auf das Degradationsverhalten von Implantatwerkstoffen (Magnesium), Implantatwerkstoffe</li> <li>• kennen und verstehen die Herausforderungen im Legierungsdesign,</li> <li>• bewerten den Einfluss verschiedener Oberflächenvorbehandlungen sowie Oxidationsparameter auf die Ausbildung schützender Oxidschichten im Zuge der Hochtemperaturoxidation,</li> </ul>

		<ul style="list-style-type: none"> <li>• verstehen die Voraussetzungen und Mechanismen die der Ausbildung schützender Oxidschichten (Hochtemperaturoxidation) zu Grunde liegen,</li> <li>• erzeugen anodisierten Bauteiloberflächen,</li> <li>• bewerten Tof-SIMS Daten,</li> <li>• wenden Rasterelektronenmikroskopie (REM) an</li> </ul> <p><b>English version</b></p> <p>Evaluation of the influence of alloying elements and coatings on the degradation behavior of implant materials, Implants elucidation of the challenges in alloy design, Assessment of the influence of different surface modification techniques and oxidation parameters on the formation of protective oxide scales during high temperature oxidation, Creating anodized components surfaces, Evaluation and interpretation of Tof-SIMS data, Application of Scanning Electron Microscopy (SEM)</p>
7	<b>Prerequisites</b>	Voraussetzungen für die TeilnahmeFundierte Kenntnisse in der Elektrochemie und Hochtemperaturoxidation. Vorlesungen vom LS LKO/ WW4 im Bachelorstudium oder äquivalente Kenntnisse. Immatrikulation im MA-Studium.
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Surface Science and Corrosion Master of Science Nanotechnology 20222

In the course of the seminar results are presented and discussed what enables a profound understanding of the techniques that are taught within</p>

		the lecture Surface Analysis. Besides this factual part, the students have furthermore the chance (and are supposed) to ask questions to the speakers. This is an important insight into the academic working environment that might be especially relevant for prospective PhD-students.
6	<b>Learning objectives and skills</b>	<p><b>Surface Analysis I + II (VI+Ü):</b></p> <p><b>Die Studierenden</b></p> <ul style="list-style-type: none"> <li>• beschreiben fundamentale Konzepte im Bereich Kristallographie.</li> <li>• diskutieren die Vor- und Nachteile verschiedener Verfahren der Oberflächencharakterisierung.</li> <li>• verstehen die theoretischen Grundlagen von STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS.</li> <li>• kennen verschiedene Herstellungsmethoden für Nanostrukturen und Anwendung von CVD.</li> <li>• verstehen den sol-gel Prozesses und können ihn wiedergeben.</li> <li>• kennen verschiedene Anwendungen nanostrukturierter Oberflächen.</li> <li>• können Verfahren zur Oberflächenanalyse bei Nanomaterialien kritisch diskutieren.</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Describing of basic concepts in crystallography.</li> <li>• Evaluating different kinds of surface characterization techniques (pros and cons).</li> <li>• Elucidating the theoretical background of STM/AFM, SEM/EDX, XPS/Auger, XRD, ToF-SIMS.</li> <li>• Defining fabrication methods of nanostructures and elucidation of nanostructured CVD.</li> <li>• Describing the sol-gel process.</li> <li>• Reporting applications of nanostructured surfaces.</li> <li>• Elucidation of surface analytical techniques for nanomaterial characterization.</li> </ul> <p><b>Seminar Surface Science and Corrosion</b></p> <p><b>Die Studierenden:</b></p> <ul style="list-style-type: none"> <li>• wenden wissenschaftliche Verfahren und Techniken in der Forschung (Beispiele) an.</li> <li>• haben Erfahrung in Bezug auf Ablauf und Gepflogenheiten im wissenschaftlichen Arbeitsumfeld durch aktive Teilnahme an Diskussionen.</li> <li>• erwerben Softskills (VortraDarstellung / Diskussion) zur Vorbereitung auf eine wissenschaftliche Karriere.</li> </ul> <p><b>The students</b></p> <ul style="list-style-type: none"> <li>• Appliance of scientific techniques in research (discussion of examples). 4	<b>Module coordinator</b>	Hans-Joachim Egelhaaf
5	<b>Contents</b>	<p><b>Lecture / Exercise / Lab work</b></p> <p>The lecture will give an introduction to coating and printing technologies for the manufacturing of (opto-)electronic devices by solution processing. Special emphasis will be on upscaling from lab scale devices to large area commercial products. The fundamentals of the different technologies as well as their application for the manufacturing of active layers, transparent electrodes and transparent barriers will be described in detail. Exercises will provide a more quantitative approach to thin film processing while lab work will allow hands on experience of the lecture content.</p>
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>• The students will be introduced to the inventory of printing, coating and patterning technologies available for the solution processing of organic, hybrid and inorganic (opto-)electronic devices (FETs, LEDs, solar cells and photodetectors) and its application to the manufacturing of organic, perovskite and quantum dot devices.</li> <li>• After discussing the fundamentals of wet film deposition (wetting, viscosity, drying), the working principles and application ranges of coating (spin coating, doctor blading, slot die coating), printing (letter press, gravure, flexo, screen, ink jet printing) as well as of patterning techniques (printing, scratching, laser ablation) will be introduced.</li> <li>• The specific requirements of "printed electronics will be introduced and compared to those of "silicon based electronics on one hand and "visual printing on the other hand.</li> <li>• The students will learn how to manufacture transparent electrodes (thin metal films, finger electrodes, nanowire meshes, transparent conductive oxides), active layers (bulk heterojunctions, perovskite films, nanoparticle layers), and barriers from the respective inks. They will also learn how to decide for the appropriate coating/printing technology. The inventory of materials for printed electronics will be presented and concepts for rational development of inks from these materials (Hansen solubility theory) will be introduced.</li> <li>• Exercises will teach the students to base their decisions for materials, coating/printing technologies and patterning</li> </ul>

		<p>methods on quantitative considerations. These will include the calculation of resistance losses in transparent electrodes, of the viscosities and surface tensions of inks as well as of the water vapor transmission rates of barriers.</p> <ul style="list-style-type: none"> <li>Deposition and patterning of electrodes, active layers, and barriers for organic or perovskite solar cells will be trained in the lab work.</li> </ul>

5	<b>Contents</b>	<p><b>Lecture / Exercise / Lab work</b></p> <p>The lecture will introduce into the specifics of electronic transport in disordered semiconductors as compared to inorganic semiconductors. As a consequence of the transport properties, quite unique device architectures are developed for disordered semiconductor devices. As a prototype representative, organic semiconductor devices (organic solar cells and LEDs) are discussed in more detail.</p>
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the major electronic transport models for disordered semiconductors. Marcus theory is introduced to describe charge migration. The Gaussian Disorder Modell is introduced to derive the temperature and field dependence of mobility and conductivity.</li> <li>Organic LEDs are one of the leading display technologies nowadays. Materials concepts for OLEDs, recombination of singlet and triplet populations, energy transfer, device architecture and production aspects are discussed Organic Photovoltaics is an emerging PV Technology. The leading materials concepts and composites for OPV are bilayer and bulk heterojunction concepts, charge generation and charge recombination is discussed as a function of microstructure.</li> <li>Single junction and tandem junction architectures are analysed, steady state and transient measurement methods are introduced to characterize such devices.</li> <li>Processing and characterization of organic, perovskite, etc solar cells, LEDs , displays or X-Ray detectors will be trained in the lab work.</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Christoph Brabec Prof. Dr. Wolfgang Heiß
5	<b>Contents</b>	<b>Lecture / Exercise / Lab work</b>  The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Shottky and Hetero Junction are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed.</li> <li>Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.</li> </ul>

- mit der Bedeutung, Herstellung, Charakterisierung, Einsatz und Bewertung von Gerüststrukturen im Tissue Engineering vertraut sein.

\*Praktikum "Tissue Engineering"\*

|Versuch 1: Polymer-beschichtete bioaktive Scaffolds für Knochen  
Tissue Engineering|

Die Studenten

- lernen kennen und wenden an: Herstellungsverfahren, Beschichtungsverfahren und Charakterisierungsmethoden für scaffold für Knochen-TE.
- können: Ein Protokoll der Experimente erstellen.
- bewerten und diskutieren: Die Verfahren und Ergebnisse der Versuche.

|Versuch 2: Elektrophoretische Abscheidung von Funktionsschichten auf Biomaterialien|

Die Studenten

- lernen kennen: Die Anforderungen an Biomaterialien, den Einfluss der EPD-Abscheidungsparameter auf die Funktionalität der Schichten.
- lernen kennen und wenden an: Das Verfahren der Elektrophoretischen Abscheidung, die Kontaktwinkelmessung als Charakterisierungsmethode von Oberflächen.
- bewerten und diskutieren: Funktionsschichten bezüglich Ihres Einsatzes als Biomaterialien; die Ergebnisse der Versuche und Verfahren.

|\*Educational objectives and competences:\*

\*Biomaterials for Tissue Engineering\*

The students need to

- comprehend the paramount importance of the concepts of tissue engineering and the role of biomaterials therein.
- to be familiar with the significance, fabrication, characterisation, application and evaluation of scaffold structures for tissue engineering.

\*Practical "Tissue engineering"\*

|Experiment 1:] Polymer coated bioactive scaffolds for bone tissue engineering

The students

- are familiarised with and apply: fabrication methods, coating techniques and characterisation methods for scaffolds for bone tissue engineering.
- are able to: devise a protocol of the experiment.
- assess and discuss: the procedures and results of the experiments.

|Experiment 2:] Electrophoretic deposition (EPD) of functional coatings on biomaterials

The students

- get to know: the requirements for biomaterials, the influence of the EPD-process parameters on the functionality of the coatings.

		<ul style="list-style-type: none"> <li>• apply: the processes of EPD, contact angle measurements as a characterisation method for surfaces.</li> <li>• assess and discuss: functional coatings regarding their application as biomaterials, the results of the experiments and the process in general.</li> </ul>

#### \*Dentale Biomaterialien\*

##### Die Studierenden

- kennen den Aufbau und die Struktur von Zähnen und die daraus abgeleiteten mechanischen und physikalischen Eigenschaften.
- kennen die Struktur und die Zusammensetzung dentaler Biomaterialien wie hochgefüllte Polymere, Dentalkeramiken oder Titanimplantate.
- verstehen die relevanten Krankheitsbilder, die zum Zahnverlust führen können und bekommen Einblick in die Kariesätiologie.
- entwickeln das Verständnis für die Prinzipien dentaler Konstruktionslehre (Kavitätenpräparation) im Hinblick auf die unterschiedlichen Restaurationsmaterialien und Befestigungstechniken.
- klassifizieren die Prinzipien der dentalen Befestigungstechnik und speziell der adhäsiven Klebetechnik.
- können den Unterschied zwischen direkter, plastischer Füllungstherapie und indirekten, prosthetischen Restaurationen diskutieren.
- sind in der Lage dentale Biomaterialien, anwendungsspezifisch hinsichtlich mechanischer, physikalischer, chemischer und biologischer Eignung zu untersuchen.

#### |\*Educational objectives and competences:\*

#### \*Composite Materials and Nanomaterials in Medical Technology\*

##### The students

- obtain an overview on the current and future nanomaterials used in medical technology.
- know specific properties, applications and advantages of nanocomposites.
- understand the composition and development of such composite materials for medical technology for applications such as coatings, scaffolds, drug-delivery systems and antimicrobial surfaces

#### \*Biomaterial Interfaces und Werkstoffoberflächen in der Medizin/Material surfaces in medicine\*

##### The students

- learn the basics of different aspects of interfaces of biomaterials. In particular, focus will be placed on the interaction between different biomaterials (polymers, metals, ceramics) with the physiological fluids and the surrounding tissue.
- can apply their knowledge in order to judge the success of the different biomaterials and to optimize the surface properties for specific applications
- know and can explain methods of surface characterization.

#### \*Dental biomaterials\*

##### The students

		<ul style="list-style-type: none"> <li>• know the structure of a tooth and their mechanical and physical properties.</li> <li>• understand the structure and the composition of dental biomaterials, such as highly filled polymers, dental ceramics or titanium implants.</li> <li>• understand the relevant clinical pictures, which lead to tooth loss, and an insight into the etiology of caries formation.</li> <li>• develop an understanding for the principles of dental design theory (Cavity preparation) with view to the different restoration materials and fixation techniques,</li> <li>• classify the principles of dental fixation techniques, in particular the adhesive technique.</li> <li>• can discuss the difference between direct, plastic restorative therapy and indirect, prosthetic restorations.</li> <li>• are able to examine dental biomaterials from a user specific standpoint regarding mechanical, physical, chemical and biological suitability.</li> </ul>

# Materials simulation

1	<b>Module name</b> 46271	<b>Foundations of Materials Simulation</b> Foundations of materials simulation	<b>10 ECTS</b>
2	Courses / lectures	Vorlesung mit Übung: Multi-scale Simulation Methods (Lecture and Tutorial) (2.0 SWS, WiSe 2024)  Praktikum: Kernfachpraktikum Werkstoffsimulation (WW8) (0.0 SWS, WiSe 2024)  Seminar: Introduction to Advanced Maths and Calculus (1.0 SWS, WiSe 2024)  Seminar: Scientific Programming with Python (1.0 SWS, WiSe 2024)	2,5 ECTS  5 ECTS  -
3	Lecturers	PD Dr. Paolo Moretti	

4	<b>Module coordinator</b>	PD Dr. Paolo Moretti
5	<b>Contents</b>	1. Mathematical and numerical background in materials simulation; 2. Molecular dynamics; 3. Monte Carlo methods; 4. Kinetic Monte Carlo method; 5. Finite element method; 6. Phase field method; 7. Lattice and network models.
6	<b>Learning objectives and skills</b>	The students <ul style="list-style-type: none"> <li>gain an overview of the problem of materials simulation across scales</li> <li>acquire knowledge on the general aspects of both atomistic and continuum modeling</li> <li>gain experience in the practical application of these methods to real problems of materials mechanics modeling.</li> <li>learn techniques of programming and data analysis of relevance in materials science</li> <li>which includes theoretical content and hands-on experience</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Materials Simulation Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Variable derzeit mündliche Prüfung (30 Min.) currently taking an oral exam (30 min.)
11	<b>Grading procedure</b>	Variable (100%)
12	<b>Module frequency</b>	Every semester
13	<b>Workload in clock hours</b>	Contact hours: 120 h Independent study: 180 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english

1	<b>Module name</b> 46272	<b>Discrete and Continuum Simulation</b> Discrete and continuum simulation	<b>5 ECTS</b>
2	Courses / lectures	Vorlesung: Foundations of Finite Element Simulation (Lecture/Tutorial) (1.0 SWS, WiSe 2024)	1,5 ECTS
3	Lecturers	Prof. Dr. Michael Zaiser	

4	<b>Module coordinator</b>	PD Dr. Paolo Moretti
5	<b>Contents</b>	1. Atomistic simulation methods; 2. Molecular dynamics simulations 3. Statics and energy minimization; 4. Continuum models for materials simulation 5. Mathematical formulation and discretization schemes 6. Finite element method
6	<b>Learning objectives and skills</b>	The students <ul style="list-style-type: none"> <li>• understand and operate the state-of-the-art modeling techniques in materials simulation, both at the atomistic level and in the continuum.</li> <li>• acquire advanced knowledge of the molecular dynamics methods,</li> <li>• acquire advanced knowledge of the finite element method</li> <li>• acquire advanced knowledge of the advanced techniques of data analysis that are relevant in material modeling, both in research and in applications.</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Materials Simulation Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Oral derzeit mündliche Prüfung (15 Min.) currently taking an oral exam (15 min.)
11	<b>Grading procedure</b>	Oral (100%)
12	<b>Module frequency</b>	Every semester
13	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	

1	<b>Module name</b> 46273	<b>Material Theory</b> Material theory	<b>5 ECTS</b>
2	Courses / lectures	Vorlesung: Foundations of Computational Materials Science I (Lecture/Tutorial) (1.0 SWS, WiSe 2024)	1,5 ECTS
3	Lecturers	Prof. Dr. Michael Zaiser	

4	<b>Module coordinator</b>	PD Dr. Paolo Moretti
5	<b>Contents</b>	1. Theoretical foundations of atomistic models 2. Coarse graining and formulation of continuum theories 3. Generalized continuum theories.
6	<b>Learning objectives and skills</b>	students learn the theoretical foundations of the models behind current state-of-the-art simulation techniques <ul style="list-style-type: none"> <li>• develop a critical understanding of current modeling tools and approximation methods</li> <li>• develop a critical understanding of relevance both for atomistic modeling and for continuum approaches</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	1. and 2. Scientific-technical elective module Master of Science Nanotechnology 20222 Materials Simulation Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Oral currently taking an oral exam (15 min.)
11	<b>Grading procedure</b>	Oral (100%)
12	<b>Module frequency</b>	Every semester
13	<b>Workload in clock hours</b>	Contact hours: 45 h Independent study: 105 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english

# Micro- and nanostructure research

1	<b>Module name</b> 46282	<b>Applied Micro- and Nanostructure Research</b> Applied micro- and nanostructure research	<b>5 ECTS</b>
2	Courses / lectures	Praktikum: Practical Course Electron Microscopy I (2.0 SWS, WiSe 2024)	2 ECTS
3	Lecturers		

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	Practical introduction, application and hands-on experience of TEM and SEM techniques for materials characterization. Recommended is the assignment to the module "Scanning Electron Microscopy in Materials Science and Nanotechnology".  The practical courses is organized as follows: Practical Course Electron Microscopy I (WS): 3 days of practical course "as block during the first week of the semester break in February Practical Course Electron Microscopy II (SS): 4 days of practical course during the lecture period
6	<b>Learning objectives and skills</b>	<b>The students will gain</b> deeper knowledge and understanding of fundamentals of electron microscopy techniques  <b>Applications</b> Hands-on experience on SEM and TEM instruments Application of advanced microscopy techniques Evaluieren (Beurteilen) Fundamentals of image and data analysis
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Micro- and Nanostructure Research Master of Science Nanotechnology 20222
10	<b>Method of examination</b>	Oral derzeit mündliche Prüfung (15 Min.) currently taking an oral exam (15 min.)
11	<b>Grading procedure</b>	Oral (100%)
12	<b>Module frequency</b>	Only in winter semester
13	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
14	<b>Module duration</b>	2 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	Practical course descriptions  Lecture notes Transmission Electron Microscopy in Material Science I & II

1	<b>Module name</b> 46284	<b>3D Characterization in Materials Science</b> 3D characterization in materials science	<b>5 ECTS</b>
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	The module focuses on the application of 3D characterization methods in materials science. Techniques on different length scales (meters down to angstroms) using different probes (e.g. visible light, X-rays, electrons) are covered. The aim of this module is to give an overview over available techniques, to teach the underlying physical principles and to point out specific advantages, challenges and limits, demonstrated on recent research examples. Focal topics are transmission tomography methods on the nano- and microscale, namely high-resolution X-ray computed tomography (Nano-CT) and electron tomography. Sample preparation, data acquisition, 3D reconstruction, data handling and analysis are taught in both the lecture and the practical course. The theoretical background of 3D reconstruction techniques for transmission tomography is also part of the lecture.
6	<b>Learning objectives and skills</b>	<p><b>Professional competence</b></p> <p><b>Knowledge</b></p> <p>Overview over 3D characterization techniques on different length scales using different probes, demonstrated on recent research examples</p> <p><b>Understanding</b></p> <p>Understand the underlying physical principles and specific advantages, challenges and limits of different 3D techniques in materials science</p> <p><b>Analyzing</b></p> <p>Learn theoretical and practical aspects of sample preparation, data acquisition, 3D reconstruction and analysis of transmission tomography on the nanoscale</p>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	1. and 2. Scientific-technical elective module Master of Science Nanotechnology 2022 Micro- and Nanostructure Research Master of Science Nanotechnology 2022
10	<b>Method of examination</b>	<p>Oral</p> <p>derzeit mündliche Prüfung (15 Minuten)</p> <hr/> <p>currently taking an oral exam (15 minutes)</p>
11	<b>Grading procedure</b>	Oral (100%)
12	<b>Module frequency</b>	Only in summer semester

13	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
14	<b>Module duration</b>	1 semester

1	<b>Module name</b> 46285	<b>Scattering Methods for Nanostructured Materials</b> Scattering methods for nanostructured materials	<b>5 ECTS</b>
2	Courses / lectures	Vorlesung mit Übung: Scattering Methods for Nanostructured Materials  Übung: Exercise Scattering Methods for Nanostructured Materials	3 ECTS  2 ECTS
3	Lecturers	Dr. Johannes Will	

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	The module focuses on the application of scattering methods for crystal structure determination in general (diffraction), the investigation of supported nanostructures and thin films (grazing incidence diffraction and reflectometry) and for the size and shape analysis of nanostructures in solution (small-angle scattering). Basic concepts of Fourier transforms will be applied to the interaction of a primary probe with a periodically ordered object. Moreover, the impact of multiple scattering events on the diffracted intensity and its angular dependence will be discussed in a unified model for neutrons, x-rays and electrons. Those theoretical considerations will built the basis for the understanding of the methods named above. For all methods, current published research examples will be showcased.
6	<b>Learning objectives and skills</b>	<p><b>The students</b></p> <p>Understanding professional competences</p> <p>Basics of Fourier transform and convolution</p> <p>Understanding of the interaction of neutrons, x-rays and electrons with atoms and their arrays</p> <p>Physical principles of the interaction of a scattering probe with an extended crystalline lattice</p> <p>Understanding how scattering methods contribute and which kind of information can be extracted for todays challenges in material science</p> <p><b>Appliation</b></p> <p>Each topic will be accompanied with suitable exercises</p>
7	<b>Prerequisites</b>	None

1	<b>Module name</b> 46291	<b>Fundamentals of Micro- and Nanostructure Research NT</b>  Fundamentals of micro- and nanostructure research NT	<b>10 ECTS</b>
2	Courses / lectures	Übung: Exercise Transmission Electron Microscopy I (2.0 SWS, WiSe 2024)  Vorlesung mit Übung: Scanning Electron Microscopy in Materials Science and Nanotechnology (2.0 SWS, WiSe 2024)	2 ECTS  3 ECTS
3	Lecturers	Dr.-Ing. Thomas Przybilla	

4	<b>Module coordinator</b>	Prof. Dr. Erdmann Spiecker
5	<b>Contents</b>	<p>The module deals with the fundamentals of micro- and nanostructure research with the focus on todays state-of-the art capabilities of transmission electron microscopy in the investigation of materials down to the atomic scale. The module begins (TEM 1 exercise, and TEM 1 lecture as part of the M1 Pflichtmodul) with the basic physics of fast electrons, their generation and guidance by electromagnetic fields and their interaction with matter in the specimen and the detector. Afterwards various imaging (BF, DF, HRTEM, STEM), diffraction (ED, CBED), spectroscopic (EDXS, EELS, EFTEM) and 3D (ET) techniques including their applications to current research topics will be introduced. The aim is always to give insight into both the contrast mechanisms and physics of as well as the achievable information delivered by the different techniques.</p> <p>The module furthermore focuses on the introduction to Scanning Electron Microscopy (SEM) in Materials Science and Nanotechnology. Amongst others, the following topics are addressed: Components of an SEM instrument Elastic/inelastic electron-probe/sample interactions, interaction volume, generation of secondary and backscattered electrons Contrast mechanisms of different detector systems Topographic und chemically-sensitive imaging Electron diffraction and its application in SEM Scanning Transmission Electron Microscopy (STEM) Quantitative X-ray spectroscopy Focused ion beams (Dual-Beam FIB, He-ion microscopy) Preparation-specific challenges Application examples.</p>
6	<b>Learning objectives and skills</b>	<p><b>The students acquire specialist skills</b></p> <ul style="list-style-type: none"> <li>• SEM lecture:</li> <li>• Introduction to the basic concepts of and physics behind SEM</li> <li>• TEM 1 &amp; 2 exercise and TEM 2 lecture in addition to TEM 1 lecture (from M1 Pflichtmodul):</li> <li>• Basic concepts of the interaction of fast electrons with matter</li> <li>• Introduction of TEM components and their functionality</li> <li>• Knowledge about the application of high resolution techniques for nanomaterials</li> <li>• Verstehen</li> <li>• SEM lecture:</li> </ul>
